I have made inquiries, and find that Baker cut through some eighty miles of the "sudd" or vegetable barrier; the other day my steamer found this quite closed up. . . . A curious little cabbage-like aquatic plant comes floating down, having a little root ready to attach itself to anything; he meets a friend and they go together, and soon join roots and so on. When they get to a lake the current is less strong, and so, no longer constrained to move on, they go off to the sides; others do the same, idle and loitering, like everything up here. After a time, winds drive a whole fleet of them against the narrow outlet of the lake and stop it up. Then no more passenger plants can pass through the outlet, while plenty come in at the upper end of the lake; these eventually fill up all the passage which may have been made. Supposing I cut through the vegetation, I may have it closed any day by a wind blowing a flood of these weeds from one side of the lake to the other; so that the only way would be to clear out the lake of vegetation altogether, or to anchor the banks of "sudd" so as to prevent the winds blowing them together. Below Gondokoro it spreads out into lakes; on the edge of these lakes an aquatic plant, with roots extending five feet into the water, flourishes. The natives burn the top parts, when dry; the ashes form mould, and fresh grasses grow, till it becomes like *terra firma*. The Nile rises, and floats out the masses; they come down to a curve, and there stop. More of these islands float down, and at last the river is blocked. Though under them the water flows, no communication can take place, for they bridge the river for several miles. Last year the Governor went up, and with three companies and two steamers he cut large blocks of the vegetation away. At last, one night the water burst the remaining part, and swept down on the vessels, dragged the steamers down some four miles, and cleared the passage. The Governor says the scene was terrible. The hippopotamuses were carried down, screaming and smothering; crocodiles were whirled round and round, and the river was covered with dead and dying hippopotamuses, crocodiles, and fish who had been crushed by the mass. One hippopotamus was carried against the bows of the steamer, and killed; one crocodile, thirty-five feet long, was also killed. The Governor, who was in the marsh, had to go five miles on a raft to get to his steamer.

Colonel Gordon's list of the losses was a sad one, and of several Europeans who formed part of the expedition scarcely one survived. He is of opinion that no man under forty years of age should venture into these inhospitable regions, and then only those who are accustomed to a similar climate. His own strong physique was only equalled by his determined will; these qualities added to a simple, pious nature, and an almost Quixotic chivalry, enabled him to accomplish marvels during his comparatively short term of government, and only make us regret the more the ultimate failure of his efforts to permanently improve the country.

Towards the latter end of 1876 he came back to Cairo. He had successfully put down slave-driving in his own province, but his efforts were made unavailing by the intrigues of Ismail Pasha Yacoub, Governor-General of the extensive Soudan district, the capital of which, Khartoum, is the head-quarters of the system. This man was at length deposed, and Colonel Gordon consented to return on having the government of the Soudan added to his own. On his way he visited Abyssinia, to arrange matters with Johannis, who having, after the death of Theodore, beaten most of his rivals and caused himself to be acknowledged king, had been giving the Government of the Khedive great trouble. The new potentate had sent an envoy to Cairo, complaining of the inroads that Waleed el Michael, his most formidable opponent, had made into his country from Egyptian territory. The ambassador was for some time detained prisoner and at last permitted to depart with presents, but without any letter; so that Colonel Gordon on his arrival found the King in the worst possible humour for listening to his mission. How he accomplished this mission, and patched up a peace between the two countries, is now historical; but the personal narrative of the events connected with the task is very interesting.

Ultimately the indefatigable Governor did succeed in crushing the slave-trade, by issuing a proclamation that "All persons residing in Darfour must have a *permis de séjour*; all persons travelling to and from Darfour must have passports for themselves and suite"; and, as Darfour surrounds the Soudan, and all slaves must pass through it before coming into the latter province, this plan had the desired effect. But the cure was not likely to be permanent; and no sooner was his strong hand withdrawn than the slave-trade was again rife in Equatorial Africa, and affording the officials a welcome method of adding to the large incomes which their peculations already brought them. Mohammedan society is essentially a slaveholding one; the institution is sanctioned by the Kor'an and by immemorial tradition, and it is absolutely hopeless to expect Moslems to condemn it seriously, however much they may yield outwardly from political reasons to the opinion of Europe. As a rule, Mohammedans are very kind and considerate to their slaves, although of course individual arbitrary acts of cruelty do sometimes occur; and the position of a slave implies no such degradation as it does in the West. Many slaves, indeed, have risen, and still rise, to posts of great power and importance. The real horrors are felt in Africa itself, whence the supply is obtained, where the slave-hunters commit such terrible crimes, and the native tribes are deadened by the baneful influences of the traffic to all sense of humanity and natural affection. Another curse of the system, for which Mohammedan polygamy is alone to blame, is the employment of eunuchs as the necessary adjuncts to the harem. Of the establishments from which these are supplied we must say nothing more

than that they exist under Egyptian Government patronage, within a comparatively short distance of the capital, and that a loss of ninety per cent. of human life is incurred in providing them. These facts are alone a sufficient comment upon Colonel Gordon's significant words, in which he brands the anti-slave movement of the Egyptian Government as a hollow sham. This book should open the eyes of Europe to the real nature of Eastern Governments, and suggest a firmer and more decisive method of enforcing the decree that has gone forth from Christendom, that slavery shall cease to exist.

HOLMES ON THE COMMON LAW.*

BEFORE this we have called attention to the danger in which English lawyers stand of being outrun by their American brethren in the scientific and historical criticism of English legal institutions and ideas. The book now published by Mr. O. W. Holmes adds considerably to the advantage gained on the American side in this friendly contest. The matter is not altogether new to us, parts of it having in substance appeared at various times in the *American Law Review*; but everything has been more or less recast, much has been added, and the effect of the whole is much improved by the consolidation. The immediate occasion of the work was the delivery of a course of lectures in Boston; to what sort of audience does not appear, but it speaks well for the intelligence and cultivation of Massachusetts law students if the average of them are capable of appreciating instruction so far above the common routine of legal phrases as this. Mr. O. W. Holmes's simple and general title covers something quite different from the string of maxims and rules, supported by more or less relevant examples and more or less plausible reasons, which we have to be content with in most legal expositions. He gives us a searching historical and analytical criticism of several of the leading notions of English law; not an antiquarian discussion first and a theoretical discussion afterwards, but a continuous study in the joint light of policy and history. He shows us how dimly felt grounds of expediency, struggling with traditional rules of which the real grounds were mostly forgotten, have issued in the establishment of principles which are now capable of being expressed in a rational form for the most part, though many minute irregularities in their application, and here and there downright anomalies, preserve the memory of conflict and compromise. Mr. Holmes does not write as a member of any school of theorists or critics, and in the handling of his subjects he owes, apparently, very little to previous authors in the same kind. Observers of hereditary talent may rather note in his subtle and original following out of analogies and presentation of familiar elements in fresh lights a sufficiently plain continuance of like powers which, exercised on more popular and various topics, have for many years charmed readers of English on both sides of the Atlantic in the works of Dr. O. W. Holmes the father. Still, Mr. Holmes may be said in a certain sense to belong to an American school of legal criticism distinguishable from anything that has yet taken root here. The difference may be seen at a glance by comparing any recent English text-book of good standing, say the last edition of Smith's *Leading Cases*, with such works as Mr. Bigelow's *Leading Cases in the Law of Torts* or Professor Langdell's *Select Cases on Contract*. One reason for the divergence may be found in the multiplicity of co-ordinate and independent authorities in the Courts of the different States of the Union, which makes a much freer and more radical criticism than we are accustomed to in England not only possible but almost necessary. And it curiously enough happens that our own decided cases, though in themselves they still form a system based on precedent and not on opinion, add to this effect in America. For in the Courts of Massachusetts, for instance, the judgment of an English Court is not a binding precedent, but only an opinion; yet it is a judicial opinion, not a speculative one, given by men having authority in a law substantially the same as that which the Massachusetts Court administers, and under analogous conditions; and the feeling of piety towards the mother-country which notwithstanding superficial discordances underlies the best thought and work of cultivated Americans helps to increase the weight of English jurisprudence. The decisions of the American Supreme Court are for the State Courts a still nearer source of weighty but not positively binding legal opinion. And the study of Continental theorists, falling on soil thus made ready for it, is eagerly taken up and fruitfully pursued. Altogether American writers are in conditions especially favourable for the detachment and breadth of view which are among the chief requisites of systematic legal criticism. For some time international law has been with them a favourite subject; but this, though by its cosmopolitan character it offers abundant facilities for theorizing, is wanting in matter which exact criticism can lay hold of; and its theoretical part belongs as much to politics as to law. The energy of American inquirers is now directing itself to legal archæology, as a field more neglected and presenting greater opportunities. We do not say that they have yet brought their school to perfection. It is not free from the over-ingenuity and captiousness which are the besetting faults of

* *The Common Law*. By O. W. Holmes, jun. Boston (United States): 1881.

ambitious youth. But they have already done good work, and, we trust, are on the way to do much more.

Mr. O. W. Holmes begins with a discussion of "Early Forms of Liability," in which he examines historically the rules of what may be called vicarious liability—that is, the duty imposed on men, in sundry circumstances and degrees, to answer for damage done not by themselves but by persons or things in their service. The original notion, in Mr. Holmes's view, is that the immediate agent in the damage is the offender. This might be a lifeless thing, an animal, a slave, or even a free person under an ancestor's power. And in archaic law the owner could escape further liability by surrendering the offending object for the person hurt, or his surviving kinsfolk, to work their will upon. Examples are found by Mr. Holmes in the Roman *noxæ delictio*, in the English deadland, and in the still existing Admiralty rule which in a manner personifies the ship. His general line of investigation is interesting, and, we think, on the right track; but we doubt if he gains much by appealing to the supposed primitive tendency to personify inanimate things. He says that things in motion, being nearer life than things at rest, were more readily forfeited as deadland. We must beg leave to differ. The phrase of the old books, *moveo ad mortem*, seems to us not to denote actual motion but to be a mere metaphorical turn of speech for causing death anyhow, as when we now speak of a consideration moving from a party. In the same Year Book of Edward I. from which Mr. Holmes quotes there is a passage (30 and 31 Ed. I., p. 529) showing that if an arrow glanced by misadventure and slew a man, the thing off which it glanced (which would naturally be in almost every case a fixed object) was forfeited. In the next three lectures we have a study of the grounds of liability for crimes and wrongs, which shows Mr. Holmes's powers to great advantage, and is to our mind the best part of the book. The general idea running through them is that even criminal law renounces, and, as a matter of policy, must renounce as far as possible, the attempt to punish according to the intrinsic moral guilt or blameworthiness of the wrongdoer. Blameworthiness is the ultimate ground of liability, but the actual measure of liability is not what is blameworthy in the particular individual, but what would, in his circumstances, be blameworthy in a man of ordinary knowledge and capacities. An external standard of conduct is established, to which the subject is bound to come up at his peril. Whether it has been conformed to in a particular case is a question in general independent of the person's actual state of mind. There are cases where a wider liability is imposed on grounds of special policy, or survives as a fragment of an earlier and ruder dispensation, or, having survived by accident, is now preserved out of a sense that on the whole it is expedient. But the general rule is that a man is not liable for harmful consequences of acts not unlawful in themselves which he had not a fair chance of foreseeing and preventing. If he had a chance sufficient for a reasonable man he is liable, notwithstanding that his individual ability or perceptions were not up to the average. Examination of the doctrines of intent and malice in the criminal law serves only to confirm this. Intent is in some cases, as in theft, a necessary index to the probable consequences of the act punished—in other words, to its dangerousness. In others, it is reducible to foresight; a truth expressed in an inverted fashion by the common maxim that a man is presumed to intend the natural consequences of what he does. And "the test of foresight is not what this very criminal foresaw, but what a man of reasonable prudence would have foreseen." The purpose of criminal law is to prevent dangerous acts as well as morally wicked ones, and "a man must find out at his peril things which a reasonable and prudent man would have inferred from the things actually known." We may add that, even in the limited number of cases where acts not appreciably dangerous to the public or to any person in particular are criminally punished as being wicked in themselves, the standard they are judged by is an external one. It has been decided that good intentions are no defence to an indictment for issuing an obscene publication. But it should be remembered that after legal guilt is established, there is mostly some judicial discretion as to the punishment to be awarded. Except as to capital offences and a very few others, for which a minimum punishment is prescribed, that discretion is in our system exceedingly broad. The consequences of a conviction for manslaughter vary from binding the prisoner in his own recognizances to come up for judgment if called upon, to a sentence of penal servitude for life. And here free play is given to appreciation of the degree of personal blame which the Court thinks ought to attach to the party under all the circumstances of the case.

Mr. Holmes goes on to show that the same principle of the external standard holds in the theory of civil wrongs, and particularly in that much confused subject the law of negligence. What the law means by negligence, he strongly points out, is not, as assumed by some modern teachers, a state of the party's mind. This is more clearly seen by taking it as what it really is, a negative term. Negligence is the want of diligence. But diligence is not something in the party's mind; it is a matter of external conduct, the actual exercise of a certain measure of intelligence and caution. That measure is determined by reference to the average capacity of men in the party's situation. And here the very roughness of the jury system makes it really a more accurate instrument than the judgment of judges sitting alone; for the verdicts of juries provide for the legal standard of duty neither being so much more rigorous than the

public opinion as to be unacceptable, or so much more lax as to be ineffectual. The ground of policy on which the law rests is that in order to carry on our affairs with freedom we must count on a certain amount of intelligence and good-will in a fellow-man apparently possessing normal faculties, and the law must hold him to make good that expectation; and the jury represents the ideal average man, than whom no one is expected to be wiser or allowed to be more foolish. They say what is the prudence of a reasonable man, taking one man with another, and their judgment is worked into settled contributions to the law by judicial decisions laying down from time to time what amounts to "evidence of negligence." Such decisions are based on the constant experience of mankind collected from juries, and preserved in the experience of judges and in legal records. Mr. Holmes has not touched one point raised by Mr. Bigelow in the book we have already mentioned, that the prudence required is not exactly the prudence of a common man, but the prudence of a man such as would commonly and properly be concerned in the matter in hand. If a man chooses to repair his own house and drops bricks on the people in the street, it is no defence for him to say that he did as well as a man could do who had not learnt bricklaying. If he will lay bricks, he must have the skill of a bricklayer at his peril. So a man who drives a carriage is expected to have the ordinary skill of a coachman. But, after all, it is only a branch of common prudence that a man should not put himself in situations where the foresight and control of consequences require a particular kind of knowledge or skill which he does not possess. It is negligence to put himself there at all, and it is vain for him to do afterwards the best that he can do by the light of nature. It may be conceived that in extraordinary circumstances a man should, as the lesser of imminent evils, take on himself the management of something as to which he knew himself to be incompetent. In such a case nice questions of liability might arise. Suppose an engine-driver to be disabled by a fit or a sunstroke in the middle of a long run; what would be the measure of the stoker's responsibility?

We have no room to discuss at present Mr. Holmes's treatment of leading ideas in other doctrines of the law; but we must not forget to say that, even if his explanations be not wholly accepted, his research goes a notable way to dispel the obscurity that surrounds the English law of contract in its earlier stages. The lecture on possession is interesting for the manner in which it works historical materials into the fabric of a closely reasoned argument against the prevalent German theories, and especially against the doctrine that inchoate or attempted ownership, the intent to deal with the thing as owner, or *animus domini* as it is called, is on principle or in fact a necessary element in constituting the kind of possessory interest which the law recognizes and protects. Altogether, Mr. Holmes's book will be a most valuable—we should almost say an indispensable—companion to the scientific student of legal history.

RECENT VERSE.*

WE fear that the *Heptalogia* will cause general disappointment to those who believe a current rumour as to its authorship; for though, as a matter of course, it is very clever and here and there laughable, the general effect is exceedingly heavy and elephantine. Mr. Swinburne, to whom it has been attributed, has shown in his prose writings that he has wit, though no humour, and when it was known that he had issued a volume of parodies, something very entertaining was expected. There are two great classic collections of parodies in English, those of the brothers Horace and James Smith, and that of Isaac Hawkins Brown. *A Pipe of Tobacco* and the *Rejected Addresses* have this in common, that they profess to be effusions by contemporary poets on one given theme. The fun of the thing was to suggest a pipe of tobacco or a newly-opened theatre as the subject for very dissimilar persons to rhyme about, and to see how Ambrose Philips would approach it, and how Swift, how Pope, and how Colley Cibber. This seems to us at once more laughable and more legitimate than to imitate rather savagely the general tenor of the poet's writing. The seven who contend against sense seem to be Messrs. Tennyson and Browning, Mrs. Browning, Mr. Patmore, Lord Lytton, Mr. Rossetti, and Mr. Swinburne himself. In the first place it is equally a mistake in flattery and in malice to place Lord Lytton in such company, and we will say nothing about the "Last Words of a Seventh-Eate Poet." Then the imitations of the two last-mentioned bards are dull and poor beyond description. That on Mr. Patmore is clever, but coarse and obvious. The other three are much more readable. "The Higher Pantheism in

a Nutshell" is a not unfair rebuke to Mr. Tennyson's facile metaphysics, and closes with a delightful line—

Fiddle, we know, is diddle, and diddle, we take it, is dee.

"John Jones" is an elaborate imitation of "James Lee's Wife." The parody is excessively laborious, curious, and clever, but in the end a wearisome and profitless poem to read. Finally, the parody which seems to us to be best worth notice is "The Poet and the Woodlouse," in which fun is made in a very innocent way of the queer jargon which Mrs. Browning used to permit herself to employ. If we allow that parody is a fit exercise of such fine powers as Mr. Swinburne possesses, it could not be more amusingly employed than this:—

"Notwithstanding which, O poet," spake the woodlouse very blandly,
"I am likewise the created—I the equipoise of thee;
I the particle, the atom, I behold on either hand lie
The inane of measured ages that were embryos of me."

"And I sacrifice, a Levite—and I palpitate, a poet:—
Can I close dead ears against the rush and resonance of things?
Symbols in me breathe and flicker up the heights of the heroic;
Earth's worst spawn, you said, and cursed me? look! approve me!
I have wings!"

In *Amaranth and Asphodel* Mr. Butler has gone, like so many poets, to the Greek anthology for his inspiration. The book is dedicated to the Khedive of Egypt, perhaps in the hope of Hellenising a potentate who has been suspected of want of sympathy with modern Greece. We hope that Mr. Butler will absolve us from any desire to be unfriendly if we confess that his translations, as a whole, remind us very curiously of the poems of Thomas Little, Esq.; they are smooth, coy, and elegantly amorous in very much the same style, a style by no means to be entirely condemned. But they seem a little too much like artificial flowers by the side of the living jasmine and lotus of the anthology. For instance, there is a lovely little poem by Asclepiades which has often been quoted as giving the very quintessence of joy in physical existence. To have translated it literally would have tried Mr. Butler's sense of delicacy, though nothing more innocent was ever written; but surely it would have been better to leave it alone altogether than to have spread out the four concise and thrilling lines into this:—

Sweet unto lips athirst is snow to drink
In summer's heat:
Sweet unto mariners, when the storm winds sink,
Spring flowers to greet:
Sweetest of all, when two fond lovers cling
Beneath one bower,
While for deep gladness both together sing
Love's praise and power.

The translation of $\chi\lambda\alpha\iota\nu\alpha$ is extremely bold. One might as well say

He lay like a warrior taking his rest
With his martial bower around him.

The "Songs of Death" are better than the "Songs of Love," though we should have supposed that Mr. Butler would hardly have cared to print his travesty of Callimachus's elegy on Heraclitus when the exquisite translation in *Ionica* is so well known. It seems a grave omission that in no case is the author of the original named.

Dr. McCosh is a most laborious writer. We recollect reading his *Nuova Italia* very few years ago, and already he presents us with a new epic in ten cantos. It is extremely difficult to criticize poetry of this kind, to which the Americans are a great deal more indulgent than we are. On the other side of the Atlantic Dr. McCosh might gain a small but compact reputation, and be mentioned during his lifetime in "Primers of American Literature." Over here we are apt to be more impatient of a lumbering and colourless style, and an exasperatingly high level of mediocrity. Dr. McCosh writes of all sorts of things—the Scotch Coast, the Literature of the Day, which he condemns as too heated, the Paris Exhibition, Insomnia, the Fall of Kars, Titian's Birthplace, and a thousand other themes, with an even vivacity which is certainly remarkable in a writer more than seventy-five years of age. Dr. McCosh is very severe on his critics; and as we cannot in conscience say that we are very well impressed by his poetry, the most generous thing we can do is to repeat the little curse that he has formulated for our destruction:—

Oh, for a fifty Pater Pindar power!
The pen of Horace, Juvenal, and Pope,
To scourge such hypercritics of the hour!
Oh, for a furlong of good hempen rope
To hang them up, like Haman, by the toes,
And teach them honesty, even to their foes.

This is strong language, but the little poets that are so fond of invoking Pope seem to forget that there was a *Dunciad*.

We sink considerably below the level of Dr. McCosh to reach the author of "a When Rhymes." The principal poem in the book was written twenty years ago. It contains a somewhat diverting list of poets, which is worth extracting:—

Dat Wattie Scott, an' Rabbie Burns,
An' Jamie Hogg, an' Ramsay,
An' Campbell bauld, an' Cowper auld,
An' Milton John, an' Dryden John,
An' dance-devouring Sandie,
An' honest, crabbed, burly Sam,
An' Goldie, poor wee dauidie.

There seems a line dropped after the reference to Johnson. For the exceeding badness of the poetry in this little book we have

been indemnified in the notes by a pleasing story, although we are not sure that it is new:—

An important divine was preaching a sermon of scraps to a congregation of country people. At the end of each paragraph, an old man in the audience would quietly remark, "that's Boston, or that's Rutherford, or that's Doddridge, or that's Baxter," as the case might be. At last the minister lost his patience, and cried "Tak the fule body out!" "Ay, that's his ain i' the binner en' ony way," said the old man, and withdrew.

In the *Flower of Nepal* Captain Greenstreet tells a romantic story of Hindu life in blank verse that is much above the average, and in such a graceful manner that the reader passes unconsciously from page to page with a considerable amount of pleasure. The landscape is new and brilliant; such lines as the following are evidently drawn, as Wordsworth recommended, with the writer's "eye upon the object":—

Below the rock, down trending towards a stream,
A rhododendron forest, far outstretched,
With rosy blossoms painted the hillside
In sunset hues; whilst Alpine primulas,
Gray lichens and brown grasses, touched the crag
With homely colours. In a tree hard by,
Clasping a scented orchis, whose bright flowers
Made sunlight in the wood, two linnets sang
Melodiously of love.

The treatment throughout this poem is well varied and well-sustained, and we cannot but fancy that Captain Greenstreet's name might be favourably known if he cultivated his remarkable gifts of narrative and description. Unfortunately the lyrical interludes are very poorly done.

The author of *Other Days* has also some smoothness and correctness of style, but is absolutely without intellectual ambition of any kind. The titles of the pieces are so mild as to be almost comic, and to suggest the ribald wit of a parodist. We have lines "Addressed to some Ladies about to travel in Italy," "On the Portrait of a Young Lady in Crayon," "To a Young Lady who was alarmed in passing through the Black Forest," and "To a Young Lady putting on a Black Kid Glove." The last begins:—

Why thus in glove of sable hue
That lily hand enshroud?
We mourn the moon escaped our view
Beneath a wintry cloud.

One piece has a title containing seventy-eight words, although these are the preface to only ten lines.

Mr. Leonard Lloyd's dramas of *A Modern Babylon* and *Judas Iscariot* have not interested us so much as the advertisements appended to them. Mr. Lloyd seems to have a wonderful reputation in the provinces. The *Banbury Guardian* says that "he exercises somewhat kingly functions in the realms of poetry," but we do not know what the dear soul can mean by that. The *Cheltenham Telegraph* asserts that "critics are all agreed that a poet of the highest class has arisen" in Mr. Leonard Lloyd. The *Guernsey Mail* uses language which would be fulsome if applied to Victor Hugo, and the *Sheerness Guardian* simply grovels before this "powerful and rising writer." The respective journals of Todmorden, Brighouse, and Rastrick unite in using the odd expression "patrons"—"Mr. Lloyd seems determined to lose no opportunity of pleasing his patrons." In our metropolitan innocence we fail to understand the *raison d'être* of all this provincial ecstasy over such productions as Mr. Lloyd's plays, which read to us, at their most serious moments, like a preposterous and rather dull burlesque.

NEW TEXT-BOOKS OF SCIENCE.*

THE rising generation of students of science may well be grateful for the succession of admirable elementary works which the enterprise of publishers, seconded by eminent masters of knowledge in their several departments, continues to pour forth. In Messrs. Longman's *Text-Books of Science* we have already well-nigh a couple of dozen of compact little manuals, by men of mark, in which an amount of matter customarily to be sought for through bulky and costly treatises, and till lately nowhere to be met with at all, is brought within the reach of the tiro, expressed in language suited to his intelligence and his wants, and bearing an authority which may command his utmost confidence. Nothing can be of greater importance at the outset of the study of nature than to make sure of the method to be adopted, and to get clear ideas of the elementary laws of physics, with a firm grasp of the rudimentary facts. In preparing his handy little volume on *Systematic Mineralogy*, Mr. Hilary Bauerman has contemplated forming a useful guide to students who would acquire a general knowledge of the subject, as well as an introduction to larger and more advanced text-books, such as those of Dana, Miller, Desclouzeaux, and Schrauf. As it is beyond the scope of a work so limited in bulk to deal systematically and in detail with crystalline forms of all kinds, his treatment has been made as general as possible, dealing with their symmetry and geometrical pro-

parties rather than the practical calculation and determination of individual examples, though in the later portion of the work, in which the physical properties of minerals come under view, much information is given as to the chemical constituents, the structural peculiarities and the physical distinctions of the best known crystals. Matters of this kind, belonging to the petrography or physiography of minerals will, it is understood, form the subject of a future volume. Mr. Bauerman lays down, to begin with, the general principles of form, showing the classification of crystals according to the number and character of their axes of symmetry: the six possible systems, all of which are represented by natural minerals, coming under three principal groups, as they are without a principal axis, or have one or three such axes of symmetry. The first of these includes the triclinic, oblique, and rhombic systems, the triclinic having no linear symmetry, while in the other two the symmetry is all of the same kind,—namely, binary. The second includes the hexagonal and tetragonal systems, the principal symmetry of the first being senary, and that of the second quaternary. The three principal axes are special to the cubic system, being those of quaternary symmetry. The four chief methods of notation indicative of the faces of crystals—those of Weiss, Miller, Naumann, and Lévy—are explained, all of which, as being of equal authority, it behoves the student to master, though that of Lévy, a modification of Haüy's, in common use amongst European mineralogists during the earlier years of this century, is well-nigh restricted to France. The important works of Descloiseaux and Mallard are written in it. For a more complete account of it the student is referred to Pisan's *Traité de Minéralogie*. Weiss's system, the least conventional of all—the unit face being indicated by the length of its intercepts upon the axes of reference, as shown in fig. 5—is in general use among the Berlin school. Naumann's method has the merit of being short and convenient; the symbols, being arbitrary, are clear and never to be mistaken. His notation is the one most extensively in use, being adopted in Dumas's popular textbooks as well as in its author's widely-read manual. But the method of Miller, the most elegant of all, developed out of the system of notation by indices first started by Whewell, is destined, our author believes, to be adopted at no very distant time by all mineralogists. For practical reasons, however, he has made use in his crystallographic chapters of a mixed system of notation; the forms being designated in the text by their symbols according to Naumann, whilst the notation of their faces is by indices on Miller's system. In demonstrating the geometrical characteristics of crystals under these different systems, the solids illustrated have been assumed as absolutely regular in shape, every face of the same form being similarly placed in regard to the symmetrical centre or origin of the axes. Such mathematical regularity is of course practically unknown in nature, so that in reasoning out the typical or abstract form, such faces as are either excessive or reduced, if not occasionally wanting or redundant, have to be allowed for. Our author consequently goes on to treat of compound or multiple crystals, falling under two principal classes, as parallel and twin groups, besides which there are a few minerals and artificial products whose crystals are dissimilarly ended, the faces limiting a prismatic zone at one end of its axis belonging to different forms from those at the other end. These crystals are not properly speaking hemihedral, their faces, though but half the full number possible in their constituent forms, being not uniformly distributed about the axis, but so grouped that, while all the faces may be present which have indices positive to an axis, the corresponding negative ones may be wholly absent, their place being occupied by some totally different form. To this arrangement has been given the name of hemimorphism. The most conspicuous examples of it are afforded by tourmaline, the ruby, silver ores, and greenockite in the hexagonal, struvite and electric calamine in the rhombic, and cane-sugar in the oblique system. Irregular aggregates, in which crystalline masses are often found in nature, as stalactites, various kinds of spar, and the beautiful capricious-looking fibrous forms resembling corals, mosses, and other organic bodies, common in aragonite, the so-called *flos ferri*, or flowers of iron, and native metals are also described, mineral masses simply amorphous being excluded from the field of view. Rules for the measurement and representation of crystals are given, with an account of the best forms of goniometer, Wollaston's reflecting instrument being chosen for illustration. The greater part of the figures in this volume are, as in most works on mineralogy, drawn in what is called parallel perspective, which supposes the sight to be at an infinite distance from the object represented, so that all rays proceeding from the object to the eye are parallel, or all lines and surfaces parallel to each other remain so in the drawing. The method of spherical projection introduced by Naumann, and brought into general use in its present form by Miller, supposes the crystal to be placed within a sphere, both having common centre lines normal to the faces, these lines being drawn through the centre to the surface of the sphere on either side. This method, as our author shows, has the advantage of representing the faces of crystals in the most general manner—i.e. by points—so that there is no limit to the number of them that can be included in a single figure. At the end of the work, after a satisfactory treatment of the physical properties of crystals, their atomic weights, and their structure in relation to chemical constitution, are given the more recent results of research into their formation by nature and their production by artificial methods.

That Mr. Magnus's *Lessons in Elementary Mechanics*, designed for the use of schools and of candidates for the London matricula-

tion and other examinations, should in less than seven years have run through as many editions, is in itself a sign of the value set upon it by students and by those engaged in education, whilst it gives wholesome evidence of the appreciation that is likely to attend all educational work based upon the same sound method, and executed with the same degree of exactitude and clearness. Intended primarily for the use of those who have had no previous instruction in mechanics, its design has been to bring into prominence the leading principles of the science, exemplifying them by familiar illustrations. With the view of showing its connexion with other branches of natural science, some few pages have been set apart to a brief exposition of the doctrine of energy, the keynote, so to say, of the modern system of physics. In preference to the plan usually adopted, the author has set forward as a principle the idea of motion being more elementary than that of force, and the need of two forces at least combining to produce equilibrium. The subject of statics has accordingly been made to depend upon the laws of dynamics, these being proceeded in turn by a discussion of some of the simplest principles of motion. He is right, we believe, in thinking that the theory of equilibrium occupies too prominent a position in many of our text-books, and that the student obtains in the problems of statics a very inadequate idea of force and of its modes of expression. The order he has adopted may be pronounced not only the most logical, but that which experience has found most practically advantageous in teaching. The beginner is taught to realize first the idea of motion, absolute and relative, the latter being the only kind of motion known to us in nature. The old Greek maxim *ἐν κινήσει τὸ πᾶν* was anticipatory of the latest generalization of science. All things on earth around us seem to be at rest, but move ceaselessly with the earth round the sun. The sun not only moves round upon his axis, but is in motion towards or round some other point in space, and so on. In all substances molecular movements are found to be for ever going on. In growth and decay there is motion of one kind. Transition and undulation furnish distinctions of another kind. Thus the science of physics resolves itself into the consideration of bodies and molecules under every variety of motion, being subdivided according to the particular effect that the several kinds of motion produce upon the senses. Locomotion, pressure, heat, sound, light, electricity, what are these but names for the different sets of impressions which motion in its different forms arouses in our consciousness? Mechanics being that branch of physics which treats of the motion and equilibrium of bodies as a whole, as distinct from the motion of their particles, and restricted in the present work to solid bodies, falls under the heads—firstly, of kinematics, or the science of pure motion; secondly, of matter that is set in motion, and the cause or force that produces it, coming under the science of dynamics; thirdly, of statics, or the science of equilibrium, comprising such problems as are connected with bodies at rest. Had we to select any portion of the work as most characteristic of the method of treatment adopted, and as compressing into a limited compass the utmost amount of recent gains to the philosophy of physics, we should point to the chapter on Energy, the distinction of potential from kinetic energy, the conversion of heat into mechanical energy, and the conservation of energy, with its relation to force and momentum. A series of well-chosen questions is appended to each chapter, and at the end is given a useful set of examination papers set at various institutions.

In *An Elementary Course of Practical Physics* Mr. A. M. Worthington has provided teachers of the rudiments of physical science with a series of experiments suited to ground the minds of learners in the first principles of practical work. It had its origin, we learn, in an inquiry set on foot by the Committee of Head-Masters amongst the scientific masters of the larger public schools, as to how far laboratory work is possible at school, regard being had to the time at a boy's disposal. Of eighteen answers, two alone were favourable, that from Rugby the most warmly so, on the ground that manipulation and observation form in themselves an important education, and that they are necessary to raise science from a mere cram subject. The spirit of the other answers seems well represented by that from the Royal Naval College, to the effect that laboratory work is not of much educational value unless accompanied by measurements which can be made only by costly instruments, experiments merely qualitative leading only to play. Such work, it is thought, is suited only for senior boys. "A master can take no more than seven or eight at a time. Each experiment would average two hours, single hours now and then being of no use." It is on chemistry, it seems, that from this aspect of things stress is to be laid as a field for practical work. But from an educational point of view our author in the interests of science claims the first place for the study of physics. Logically, he urges, it precedes all the other experimental sciences, every one of which has special instruments and appliances of its own, the action of which is purely physical, depending upon the readiness with which the manipulator devises, understands, and handles such appliances. Yet this fundamental study, which should beyond all others be soundly and thoroughly fixed in the mind of teacher and learner alike, is in danger of being left out of sight, or to be picked up at hazard as mere rule of thumb work. The course here laid down by him within fifty pages comprises about the same number of experiments suited to a class of a dozen boys under fourteen years of age. Having been tested at the Salt Schools with success, it is about to be introduced at Clifton College for a class of thirty boys. So far from being dependent upon costly apparatus, the entire list of laboratory appliances comes to a little more than 10*l*. The merit claimed for it by the author is that this course

affords a good training in (1) skilful manipulation; (2) exact observation; (3) intelligent and orderly recording of observations; (4) principles of indirect measurement; (5) the application and intelligent use of arithmetic, geometry, and algebra; (6) the varying of experimental combinations; (7) common sense. Simple equations and two books of Euclid will carry a boy to at least the middle of the course. The boys are found to work best in pairs. They are led on from simple measurements of objects at hand, or the apparatus in use, to finding the centre of gravity, the length and weight of twisted as compared with straight wires, the density and specific gravity of liquids, the oscillation of pendulums, the laws of torsion, the density of solids by weighing in air and in water, making a barometer, determining latent and specific heat, and finding the co-efficient of expansion of air and of mercury. The pupil who has made himself master of this short but comprehensive course will have reached solid ground in elementary physics.

DAVID BROOME, ARTIST.*

MRS. O'REILLY is known, and not unfavourably known, as the author of several short tales. Her *Sussex Stories* we noticed with praise so late as last autumn. Unfortunately she has not been content with going on in the line in which she had met with success; but, either of her own movement, or encouraged by outsiders, she has ventured on a novel of the orthodox dimensions of three full volumes. The frog of the fable, for all we are told, might have very well passed muster as a simple frog. It was not till it came to puff itself out beyond its natural dimensions that it became a failure and an absurdity. There is no worse enemy to many a storyteller than the third volume. On not a few, indeed, even the second can bring utter ruin. There are plenty of writers who can write very well so long as they allow their heroes and heroines but a couple of chapters or so of existence. Let them venture on a longer tale and a more complicated plot, they at once become as much embarrassed as the wife of a sheriff or an alderman who, for the first time in her life, has to manage a long train as she is presented at Court. So long as her dress had scarcely touched the ground she had gone on well enough, but when it was lengthened by a good yard of stuff, then she fell into the most awkward gait. Our lady writers have, we must admit, this excuse—that it is the novel-readers, making their demands felt through the owners of circulating libraries and the publishers, who set them on thus to make three volumes instead of one. We are willing to allow that, so far as their ordinary readers are concerned, the excuse is valid, but with the unhappy reviewers it has little or rather no weight. We suffer too much as we struggle onwards to the end to be able to listen to any plea of indulgence. When at last we have sifted the pile of rubbish, it matters nothing to us why it has been made so huge. That it contains here and there something that is good does not in the least improve the case. On the contrary, our indignation swells as we consider how either compliance with a foolish fashion or a real ignorance of the writer's trade has made that long and bad which might have been short and good.

To pass from these more general considerations to the story before us, we cannot but express our regret that the author of *David Broome, Artist*, has overshot her powers as much as she has her reviewer's patience. There is not a little that we like in her writings. Mrs. O'Reilly's tone is always pure, and her aim wholesome. It is a great pity, however, that she has a failing that is so commonly found in the sermons of some of the most virtuous and admirable men. She runs the risk of boring people before she has succeeded in amending them. Like the preacher, she may likely enough put her audience to sleep before she has unfolded and enforced her moral.

Her sentiment, moreover, is too often somewhat weak, and at times is worn to rags. She has such a wish that every one should make a good ending, that she never indulges herself or her readers in a downright villain. She makes some of her characters, indeed, commit the most atrocious crimes; but she takes care to keep them so well in hand that they can all repent before they die. Her villains are too bad or too good. They are not consistent. They seem to be all along in training both for the gallows and the "Salvation Army." She might have gratified the reader by cutting off at least one in the blossoms of his sin. Too much penitence may give a story a sickly taste, just as too much sugar may spoil a pudding. Once, indeed, in her story a great rogue is going to drown himself, but the virtuous hero—and a stupendously virtuous hero he is—comes up just at the nick of time, and puts a stop to the suicide. It is not, indeed, by any chance that he stops at the pool at the very moment when the rogue was going to plunge in. He had had an unaccountable impression that some one was near, a presentiment that impressed his vivid imagination. Did he determine on moving, the same wholly unaccountable impression mastered him. Was he later on once more about to move, the mysterious impulse to remain returned in full force. It is a pity, by the way, that these impressions and impulses are not rather felt when the life of a respectable member of society is at stake. In one class of novels, however, there is no more dangerous state than that of being what people call prepared for death or fit to die.

Such people are swept off without any remorse, while the wicked have, at all events, a reprieve granted them.

Not only is the sentiment of this story often false, but the plot is of a most complicated nature. We do not at any time feel sure that we have sounded all its depths and thoroughly mastered its intricacies, while for nearly two volumes we are in a state of the greatest perplexity. We are quite willing to allow that the heroine should have her three lovers, for it is never to lovers that our state of bewilderment is due. The first glance always enables the practised reviewer to detect who it is whom a heroine is to marry, however much appearances may point to some different result. In the present case we found out that the hero was in love, or, at all events, was going to be in love, a good two volumes and a half before he had found it out for himself. It is not, then, of lovers that we complain. They may rise against us as likelinesses of the King rose against Douglas on the field of Shrewsbury, and they will give us no trouble. But we must raise an outcry when we are faced by a mysterious child, who is left as an outcast, by a still more mysterious woman, at the house of the virtuous hero. For many a long page the parentage of this youthful mystery is made to worry the reader almost as much as a swarm of midges or the toothache. If to preserve a mystery is one part of the novelist's art, certainly Mrs. O'Reilly here deserves her share of praise, for we defy the reader even to hazard a guess as to the origin of this highly objectionable boy. His father at one time we believe to be a forger, who is still serving his time as a convict. At another time we are almost convinced that he is the son of a woman who was to have married the good hero, but was tricked by his wicked cousin into marrying him. Her baby had died, she had been told, at a time when she was delirious. What more natural than that he should not have died at all, but have been stolen, either by his foster-mother or the mysterious woman in whose possession we first meet him? Who he was we will not reveal, but we may let out that, though his foster father was not in prison, he fully deserved to be; for he, too, had been a forger and a scoundrel in general. The boy, of course, reforms, like every one else; and at the present time, instead of being a pickpocket, is likely enough a churchwarden.

The descriptions of scenery and of places, which are scattered about with a too liberal hand, do not, in our opinion, by any means help us through the mysteries. We knew only too well what was coming when the story opened in a greengrocer's shop, and we read how "red-ripe berries, golden-brown potatoes, and piles of fresh green vegetables contrasted well with one another. It was an idyllic sort of business," the author adds. Idyllic or not, "golden-brown potatoes" were too much for us. Even in "word-painting" a line ought to be drawn, and it should certainly be drawn some way above potatoes. If we are not careful, we shall sink down to onions, and from onions to artichokes. On later pages we certainly get into higher society, and are introduced to a breakfast-table that glittered with silver and was decked with flowers. The owner of the house and his wife alone were present. She, we read, presiding over the teapot, wore a rose in the waist-belt of her dress. Two pages later on we find that her husband drank coffee. Can, we would respectfully ask—can a woman be said to *preside* over a teapot which is for her own use, and for hers alone? It is, we are well aware, a favourite term with women authors, for it seems to imply a certain dignity, if not, indeed, actual power; but for that very reason we are justified in insisting that it shall be kept to its strict use. But from "word-painting" we are getting to women's rights, and where they will lead us none can know. As Tristram Shandy wrote, "The controversy led them naturally into *Thomas Aquinas*, and *Thomas Aquinas* to the devil." We will, therefore, stop short while yet there is time, and retrace our steps. What, we would ask our author, is gained by giving such a description as the following of a house in the West-end of London during the month of September?—

The sunshine would have penetrated within, had that been possible, and would have lit up the gilding and paint, the rich amber-coloured curtains of the drawing-rooms, the pictures, statues, china, and handsome furniture of which the house was full, but shutters were closed jealously, and blinds drawn down. Still, do what Mrs. Dryson the housekeeper might to exclude those long, warm beams, they persisted in finding their way through chinks in the shutters, or where blinds did not hang absolutely straight, and so lay upon the carpets, or made bright bands upon the delicate tints of ceiling or cornice, driving the housekeeper to distraction as she visited one room after another, to make sure that nothing was getting faded or tarnished, and found the sunshine before her always.

Let our author, we beg her, not attempt to write so big a book that, in order to get it filled, she must have recourse to long descriptions of what is not worth describing even briefly. She has a certain power of her own. In these three volumes there are parts which are very pleasing. The heroine, though her name, Leticia, is certainly the last that a greengrocer would be likely to give his daughter, is yet a charming young lady, and well deserves her three lovers, and even half-a-dozen more, had she needed them. The hero is a little tiresome, if not indeed oppressive, with his virtue, and might surely have a little sooner found out that he was capable of becoming a lover. Still, even he would have passed muster very well, had we had much less of him. Some of the minor characters are well drawn. With all its faults, and that they are many we have not failed to show, this story is likely enough to find many readers, and to interest them, in spite of, or perhaps on account of, the serious defects which we have had to point out.

* *David Broome, Artist*. By Mrs. Robert O'Reilly, Author of "Phoebe's Fortune," "Sussex Stories," &c. 3 vols. London: Sampson Low & Co. 1881.

IN THE ARDENNES.*

THE general mass of English, and perhaps of all, tourists may be divided into two classes—those who resolve to do as others do, and those who determine to go somewhere with the certainty that only the select few will be found on the same track. The first class are inspired by the amiable desire to have the power of talking to their neighbours about the places they have visited and the sights they have seen. The second have the less amiable ambition of speaking loftily of localities which have never been penetrated by the vulgar herd. On the whole, we are disposed to like the first class better than the second, and even to think them the wiser, on the principle that "everybody" is wiser than "anybody." Of course there is a small third class, who go where they like to go, led by their own personal tastes and by their reasonable expectations of instruction or amusement; but they are probably a small minority.

The district which is known as the Ardennes has little chance of being known to either of the first two classes we have referred to. It never has been fashionable, and it never will be; it will probably never, or not for a very long time, be visited by any one because others go there; nor is it sufficiently "out of the way" to prove attractive to those who are in search of unbeaten tracks. Who would think of boasting that he had been in the Ardennes when he might brag that he had been in the Salz-kammergut? Yet Mrs. Macquoid is right when she speaks of the Ardennes as a delightful province in which many a picturesque journey may be taken, although with equal right she speaks of it as being unfrequented, and she has done well to add this volume to her previous entertaining books on Normandy and Brittany. We quite believe that many a quiet and meditative traveller, who has already "done" the ordinary routes in Switzerland and Italy and France, and who detests mobs of tourists, and cares nothing for the glories of Alpine-climbing either in Switzerland or out of it, will be grateful to the author for leading him to a district so charming in all its natural features, and so comparatively undisturbed by the bustle of the outer world. It is, in fact, somewhat remarkable that the Ardennes has been so completely overlooked. Tourists to the Rhine and Switzerland skirt it on the North—at Namur, Liège, and Verviers. Since the Franco-German war a good many resolute sightseers must have seen its southern side at Sedan; yet few of these have ever penetrated the "Forest of Arden." Even the *habitués* of Spa, we are told, scarcely do more than take a day's drive to Coo; few of them remain to enjoy the beautiful scenery which surrounds that pretty village.

We are not sure but that the route of these travellers might have been improved; but what traveller has not thought he had done better, or could have done better, than those who came after him, or had gone before him? Once or twice Mrs. Macquoid intimates that they had departed from a better plan which they had already formed, or might have done better than they did. These, however, are small matters, and, taking her book as it stands, it will be a useful and pleasant guide to those who may think of visiting the district which it describes, and will give a very fair notion of what it is to those who may have no such intention. After a few introductory remarks, the writer suggests several routes, and then lands us by way of railway at Brussels and Namur, whence she takes us up the Meuse to Dinant. This little town is not altogether unlike its almost namesake, Dinan, in Brittany. It has very nearly the same population, somewhere about 7,000 or 8,000; it stands on a river, and the ground rises abruptly from the river-side, the chief difference being that, in the case of Dinant, the principal streets are down by the river-side, instead of being on the top of the hill. Both of the little towns have something of a history, too, in the past, and one altogether out of proportion at least to their present size and importance. The legends connected with the Breton Dinan are tolerably well known, at least to the considerable *colonie anglaise* which has for many years flourished there. Daguesclin and "Thomas of Cantorbéry" are household words among French and English in that antique, untidy, and somewhat odorous little town. There is no English colony at Dinant, although from time to time some artists may be found here, who are making sketches in its charming neighbourhood, and in the forest of the Ardennes.

It may be worth mentioning that the painter Wiertz, of eccentric genius, was a native of Dinant. Probably few who have seen his fearful and wonderful legacy of pictures at Brussels will be attracted to Dinant by such a consideration. In fact, the great charm of this whole region is that there is "very little to see." Most travellers who have been in a party which had been working very hard at sightseeing can remember the ill-concealed delight depicted on the countenances of their companions when they had arrived at a place where there was nothing to see, and nothing to do but rest and dine. There certainly is this charm about the Ardennes that the traveller can wander about at his own sweet will, feeling under no obligation to visit picture-galleries, churches, or battle-fields, unless he goes out of the forest to Sedan or Laon. Dinant, however, as we have said, has a history of its own; and, indeed, the Dinantians of old seem to have been terrible fire-eaters. Near it was the rival town of Bouvignes, with which it lived in constant enmity. We need hardly remind our readers that this place is no more to be confounded with Bovines than

is Dinant to be identified with its namesake in Brittany. But Dinant was not contented to fight its battles with Bouvignes. It provoked that excellent monarch Philip "the Good," of Burgundy, who unfortunately for them was not one of those who turn the left cheek when they are smitten on the right. To defy and insult the Duke was bad enough; to hang his ambassador was unpardonable. The town was brutally pillaged and burned; the priests, women, and children were spared; the men were mostly put to death, eight hundred prisoners being hung into the Meuse and drowned before Bouvignes.

Mrs. Macquoid mentions that the Dinantians were not cured of their insolence even by this terrible calamity, when, as an old French writer says, the town "was burned down in such a fashion that it looked as if it had been in ruins for a century." About a century later, when summoned to surrender to the French by the Duc de Nevers, they sent back the answer that, if they could lay hold of the Duke and his master, they would roast and eat their hearts and livers—a pleasantry which cost them the sacking and burning of their town.

These incidents may be regarded as fairly historical; but a salient feature in the present volume, after its descriptions of routes and scenery, and its pleasant gossiping sketches of the country people and their ways and their chatter, is the legendary lore which Mrs. Macquoid has collected from place to place and put upon record in her book. It is very curious what a prominent part the Evil Spirit plays in these stories. In this respect, perhaps, the legends of most unfrequented districts are very much alike. In these, however, we fancy there are fewer illustrations than usual of the aphorism that "the Devil is an ass." Too frequently, we regret to say, his satanic majesty has the best of it; and even when he is worsted, it is not always by such means as can be quite approved of. The legend of St. Remacius has a mixture of both elements. According to that, Satan, in the form of a wolf, had killed the Saint's ass Jack; but being caught in his rosary was kept for a time, and made to do the work of his victim. After undergoing considerable toil and humiliation, he made his escape through the rosary slipping from his neck. This story, let us note in passing, is connected with the neighbourhood of Bouillon, the home of Godfrey the great Crusader. The story of the Lords of Samréo and Berismónil also introduces Satanic agency, and in a more horrible form. Far pleasanter is his defeat at Stavelot, if we cannot entirely approve of the manner in which it was accomplished. St. Remacius had determined to build an abbey in this place in order to overthrow the power of the Prince of Darkness, who had full sway over the locality. Satan naturally did his best to hinder the work, but in vain. At last he determined to heave a great block of quartz on to the roof of the abbey in the middle of the consecration service. St. Remacius, however, became aware that he was on the road, carrying the huge stone with some difficulty up the hill. He caused all the old shoes and sandals they could get to be stuffed into a sack, and sent "the most saintly of the brethren" with the collection to meet the enemy. When Satan asked the monk how far it was to Stavelot, the monk emptied out the contents of his sack, and informed him that he had worn them all out since he left the town. Apparently the Father of Lies had not the power of discerning the character of the statement thus made; so, with a dreadful yell, he flung down his load and disappeared. This story, if not irreproachable, has certainly elements of edification in it which are absent from some of the others. As we have remarked, the Evil One has too frequently the best of it; but that is not the writer's fault; she tells the tale as it was told to her.

Generally speaking, Mrs. Macquoid has shown taste and sense in the selection of objects for description and in the manner in which she has described them. Her talk about the architectural features of Laon and of Liège, for example, is very pleasant; and she seldom makes mistakes, for she knows how to avoid getting out of her depth. Once we meet with a queer sentence. "The peasants," she says, "speak what is called Walloon, the ancient French idiom, which, according to some writers, is the ancient Gallic language." Now, there is no doubt that the Walloon is a species of French; but what Mrs. Macquoid means by the ancient French idiom which, according to some writers, is the ancient Gallic language, we cannot imagine. The ancient Gallic language was a Celtic tongue. The old Frankish language, spoken at Laon for example, one of the Frankish capitals (a fact which Mrs. Macquoid does not think it necessary to mention) was as certainly a Teutonic or Germanic language. The French language, properly so called, is just as obviously a Latin or Romance language. But this is quite an exceptional slip. We should add that the illustrations are charming, as they seem also to be accurate.

MINOR NOTICES.

PROFESSOR JOSEPH B. MAYOR'S first instalment of a full and elaborate edition of Cicero's treatise *De Natura Deorum* (1) has remained over long in our hands without receiving the notice which is its due. The work itself is of but moderate interest, like all Cicero's philosophical writings. Of original thought there is neither

(1) *M. Tullii Ciceronis de natura deorum libri tres*. With Introduction and Commentary by Joseph B. Mayor, M.A., Professor of Moral Philosophy at King's College, London, &c. Vol. I. Cambridge: University Press, 1880.

* In the Ardennes. By Katharine S. Macquoid. London: Chatto & Windus, 1881.

any trace nor any profession." It has a certain worth as secondary evidence of the topics and arguments current in the post-Aristotelian Greek schools; but the independent sources of evidence, though not satisfying, are enough to show that Cicero is a witness not above suspicion as to his intelligence, and to make him more than suspected as to his fairness. The Epicurean school, in particular, is grossly misrepresented by him here and elsewhere. Perhaps the chief entertainment a modern reader can find in the philosophical dialogues of Cicero is to observe how venerable are all the controversial commonplaces of natural theologians and their opponents. Thus the standing difficulty about a creation taking place at one time rather than another is clearly enough given by the Epicurean spokesman in this book. Again, one of his taunts addressed to the Stoic, "ut tragici poetas, cum explicare argumenti exitum non potestis, confugitis ad deum," has a curiously modern ring about it. There remains, of course, the interest of Cicero's Latin, which is always worth studying as a work of art for its own sake. And in this case we see him deliberately making experiments on the language to extend its powers of representing the Greek philosophical vocabulary, and, if not actually coining words, fixing upon them the technical senses in which they have remained as part of the common stock of the civilized world. *Providentia* is a conspicuous example. The critical part of Professor Mayor's work appears to be exceedingly well done. In forming the text he has strictly observed the methods of modern scholarship, which holds itself bound not only to supply a reading plausible in itself, but to show how the corrupt reading that has to be emended came to take its place. A few conjectures of the editor's own are introduced. One of these, at the beginning of cap. 26, is especially ingenious. The common reading is:—"Hoc intellegere quale esset, si in ceris fingeretur aut fictilibus figuris." The conjunction of *fingeretur* and *fictilibus* in different meanings is displeasing, and not like Cicero, and Professor Mayor suggests *diceretur*, accounting for *fingeretur* as follows. The repetition of the letters CER in SI IN CERIS DICERETUR led some copyist to write SI INCERETUR; and this again was taken for SI FINGERETUR, "which would be likely to maintain its ground against the true reading, even after the insertion of *in ceris* from another text." A material addition to the general critical value of the book is the full collation of several English MSS. which has been undertaken by Mr. J. II. Swinson. Professor Mayor seems to intend his edition to serve the purpose of a general introduction to the history of Greek philosophy, and his commentary is very copious and lucid; so much so that we are inclined to think it open to objection as likely to save students more trouble and thought than is good for them. In Cicero's own words in this book, "obest plerumque is qui discere volunt auctoritas eorum qui se docere profitentur; desinunt enim suum iudicium adhibere." The only place where we can suggest an additional illustration is cap. 38, *init.*, where the use of *hippocentaurus* as "a stock word for a *non-ens*" might have been exemplified from the Digest as well as from philosophical literature. (Si ita stipulatus fuero: *te sisti*; nisi *steteris*, *hippocentaurum dari*? proinde erit atque te sisti solummodo stipulatus essem: Celsus in D. 45. i. de verborum obligatione, 97.)

Grave associations connect themselves with *The Churches of the Nene Valley* (2), for, though the title-page is dated 1880, the preface is signed 1877, and the name which appears at the end of it, and among the authors, is one to which the ordinary etiquette of authorship would have prefixed "the late." Among his many claims upon the gratitude of architectural students earned in the course of his laborious life by the scholarly and erudite Mr. Sharpe, of Lancaster, was the merit of conducting very popular and successful architectural tours, which he had the talent to make contributory alike to the education of his fellow-excursionists and the promotion of architectural science. Of one of those tours this volume is the result. The ecclesiological notices of Northamptonshire are known to all lovers of our old churches, so we need hardly expatiate on the interest of this collection of measured drawings comprehending all the phases of our old architecture, from the Saxon of Barnack and Earl's Barton and the Norman of the churches of Northampton and the very graceful Early Pointed of St. Mary's, Stamford, and Raund, down to the more developed forms presented by the round St. Sepulchre's in the county town and the stately Perpendicular of Titchmarsh.

In spite of degradation, mutilation, and restoration so called, undertaken in days when men had hardly yet learned so much as how to decline the verb "to restore," and in spite of the Vandalic destruction within the memory of many still living parishioners of its solemn nave, and the substitution of a flimsy pile, bejewelled and begallered inside, and externally constructed according to the worst pattern of conventicular sham-Gothic, the Priory Church of St. Mary Overie (3), or, as it is now usually designated, St. Saviour's, Southwark, asserts its claims to be recognized as a first-class specimen of a church, which is only not first class itself because its dimensions fall a little short of those of our principal minsters. It has been a labour of love with Mr. Dollman to illustrate this church in all its aspects of beauty and of deformation. This book will, we are sure, be the standard work of reference upon its subject-matter; and we cannot offer to the writer a

better wish than that, whenever it is reconstructed to serve as a cathedral, the promoters of that good work may own that their labours have been made easy to them by the studies of Mr. Dollman.

We had recently occasion, while noticing Mr. J. W. Clark's work on Cambridge, to express our regret that its illustrations should have been all but exclusively devoted to that Cambridge in its modern aspect with which the visitors of the May term are so familiar. We have now to call attention to a collection of very picturesque illustrations, not indeed of the Cambridge which has passed away, but of that which in too many instances is the Cambridge of the sixteenth and seventeenth centuries, which is ruinous, tottering, and ready to be swept away (4). The artist is Mr. Farren, who has by these engravings established his reputation as a spirited and successful etcher, while he has been fortunate enough to secure the assistance of Mr. J. W. Clark for the letter-press. The collection illustrates not only the town itself in its civic as contrasted with its academic aspect, but also the neighbourhood, conspicuous as that is for possessing several fine churches.

It is evidence alike of the solid value, both of Rickman's *Gothic Architecture* (5)—of which the first edition appeared in George IV.'s days, and in a due course of years passed under Mr. Parker's editing—and also of Mr. Parker's own manual of architecture (6)—not to refer to Mr. Parker's own evergreen vitality—that new editions of both books should have appeared this year under the same veteran superintendence. Rickman's book, in its successive forms, is of course in ever-diminishing degrees Rickman's genuine production. Still, we are glad that the name of the worthy Quaker mystagogue of the ecclesiastical architecture of the Middle Ages should not have been allowed wholly to fall out, even if it is regarded in the more practical than dignified aspect of a dignified and ancient trade-mark of an established manual.

Mr. A. Capes and Mr. J. M. Capes, in their *Old and New Churches of London* (7), have struck out the good idea of representing in one volume specimens both of ancient and modern London churches. But it is a pity that the execution is not more careful; the illustrations might have been kept up to a more uniform level, and the descriptions worded with the technical accuracy of modern ecclesiology.

Mr. Bridgett, in his *History of the Holy Eucharist in Great Britain* (8), collects a good deal of curious information, from the Roman Catholic point of view, upon the branch of religious archaeology to which he has directed his studies. But the work is not characterized by any very critical treatment. Mr. Bridgett will probably reply that he wrote in the spirit of faith and not of criticism, to which our answer would be that, as both faith and criticism are attributes of truth, so they are quite compatible with, and indeed complementary of, each other.

The Christian Knowledge Society was well inspired in planning for England a series of diocesan histories. Counties have, under the revolutionary influence of civilization, much lost, and are daily more and more losing, their status of organized communities and sinking into geographical areas. But the dioceses of the land have not only still within their attributes the elements of distinctive life, but have actually since the Church revival, and the consequent resuscitation of cathedrals, and the creation of diocesan societies, boards of education, organized *œuvres*, specialist schools and colleges, and finally diocesan conferences, reasserted an individuality which the waste that unhappily marred the Reformation and the consequent sleepiness of subsequent generations had gone far to obliterate. The series begins, as it is right and proper that it should do, with Canterbury (9), and for the metropolitan see a writer in all ways fitted for his task in learning, tastes, and acuteness was found in Canon Jenkins of Lyminge. Four hundred and twenty-two small pages is a very brief margin within which to write from Norman days (for Canon Jenkins is not content to begin with Gregory the Great's mission of Augustine), the history of the reciprocal action of the Christian system and of secular civilization upon the life, habits of thought, manners and institutions of the peninsula lying between the Thames and the Uchannel. It is therefore no little commendation to be able to say that the author has brought to his work accuracy, research, acuteness, as well as the advantage of an incisive and picturesque style. We must in passing express some surprise that Canon Jenkins, ranging as he does over so wide a field of ecclesiastical interests in and about Canterbury, and familiar as his pages show him to be with St. Augustine's Abbey and its mediæval fortunes, should have totally forgotten to notice the greatest event in the Church history of Canterbury for certainly this century—the restoration to religious uses of the ruins of the

ancient house of St. Peter, St. Paul, and St. Augustine by their dedication in a condition of most careful and conservative repair as the missionary College of St. Augustine on St. Peter's Day, 1848.

Mr. Jones in his *Diocesan History of Salisbury* (10) does not dwell so much upon the social relations of Church and State as Canon Jenkins, but he gives in a short compass a carefully digested body of information of the condition of the see of Sarum at the various periods of its existence.

Captain Douglas Jones's volume (11) contains somewhat ampler detail than an earlier one on the same subject by Captain Boughey. It will probably be patronized by young officers desirous of taking a short cut through the "Army Discipline and Regulations Act." What is more needed perhaps is a work which shall give all the necessary information conveyed in the Act, disencumbered of the verbiage which obscures the intentions of such documents for those in whom the lawyer instinct is not acutely developed.

Mr. Sell's *Faith of Islam* (12) is a minute exposition of the tenets and doctrines of a religion which has an immense importance for Englishmen. Familiar as the name of Islam is, the creed of the followers of Mohammed is but very imperfectly understood by most Europeans, chiefly owing to the abstruse and difficult character of the Arabic works in which it is expounded. This ignorance is especially conspicuous amongst the very class to whom it is most fatal—namely, to missionaries in Moslem countries. In the work before us the practical and speculative sides of Mohammedanism are so fairly and clearly discussed, and every detail of observance and doctrine so plainly set forth, that a diligent study of it will place the reader quite *au courant* with the ideas of Moslem theologians.

Dr. Wells's *Turkish Grammar* (13) is a useful manual of acquiring the Ottoman tongue as spoken in Constantinople, and contains numerous exercises for translation from English into that language. It is an improvement on most of the preceding grammars, inasmuch as it is written on the same lines as the most approved manuals for the study of modern European languages. Apart from the increasing necessity for acquiring a knowledge of the language of a people whose affairs enter so largely into the politics and commerce of the present day, Turkish possesses an extensive and valuable literature well deserving of study. The dialogues at the end of the work are very idiomatic and well arranged.

Mr. Hodgson (14) has committed the mistake of explaining his title, which is striking and attractive. The first two essays suffered, it appears, the not unusual fate of rejection by magazines. Although we can find nothing in them to make us pass a very severe judgment on this conduct of the editors, we are of opinion that Mr. Hodgson's writings deserved a better fate. The larger and better part of the prose in the volume is devoted to De Quincey, of whom Mr. Hodgson is obviously a student and lover. His critical examination of that writer's works is readable, and does not perhaps lose in interest by being inspired by a too ardent admiration. We may dissent from such estimates of De Quincey as Mr. Leslie Stephen's without being able to agree that "no one touches and lays bare the inmost heart of a subject" as he does. Among the essays is one on English verse, which Mr. Hodgson begins with the unanswerable statement that "Critics of poetry are often much at sea with regard to the principles of the art, the productions of which they criticize," and he then contributes his effort to define what is not susceptible of definition. At the end of his volume he illustrates his theories as to verse by his own practice in a series of translations from the classics. We cannot give them the praise of being more than bold. He has followed many other translators and attacked the "*Donec gratus*," giving a rendering which is inferior to many previous failures; neither can we accept "So black a crime lies at religion's door" as even an approach to the famous line of Lucretius.

Mr. Lauder has made a collection, obviously meant for children, of every species of tale, supernatural or not, long or short, which can in any way be attached to the Hartz Mountains (15). Some are undoubtedly legends, and have the usual family resemblance to other legends; some are mere anecdotes, and not a few are apparently historical tales of the writer's own invention. It is well, no doubt, to have as much local colour as possible in such stories; but it ought not to be done by keeping foreign words in the English text. The child who reads the Legend of the Rosstrappe will be severely puzzled by being told that the King of Bohemia "took a three days' *Bedenkzeit*" to decide whether he should allow the fierce giant from the north to marry his lovely daughter or not. For the rest, the child is to be envied who learns to read from such a collection.

Mr. Egan has written a sentence in the "observation" that

(12) *The Faith of Islam*. By the Rev. E. Sell. Madras: Addison & Co. London: Trübner & Co. 1880.

(13) *A Practical Grammar of the Turkish Language*. By Dr. Charles Wells. London: Bernard Quaritch. 1880.

(14) *Outcast Essays and Verse Translations*. By Shadworth H. Hodgson, Hon. LL.D., Edin. London: Longmans, Green, & Co. 1881.

(15) *Legends and Tales of the Hartz Mountains*. By Toofie Lauder. London: Hodder & Stoughton.

stands as preface to his translation (16) which raises some doubt as to the style in which he has done his work. He says:—"I have left the translation nearly as I wrote it off, thinking that a certain smack of foreign idiom and construction lent a somewhat piquant flavour, which seemed likely to be lost when attempts were made to polish up too much." This looks at first as if he had dashed his work off, and trusted to bad English to represent Heine's German. On examination this turns out to be a quite unnecessary fear. Mr. Egan's English has an easy flow throughout. Here and there we meet a little slip—as, for instance, when "an old red-haired" woman in Frankfurt tells Heine "I live servant with Madame Wohl's mother"; but this may be the fault of the printer. The English readers who wish to get some idea of Heine's style and humour through some medium less likely to be false than a translation of his poetry may be recommended confidently to trust to Mr. Egan.

The Annual Register for 1880 (17) seems to us to be better edited and arranged than was last year's issue of this valuable record. Perhaps the space given to the fine arts may be thought somewhat scanty; but it is, no doubt, impossible to gratify every taste in a work of this kind.

Messrs. Ward and Lock's *Home Book* (18) seems worthy of its second title—"a Domestic Cyclopædia." The work is not only practical and useful, but is decidedly amusing as a book to dip into at odd minutes.

Messrs. Remington and Co. have published a translation of Mérimée's letters to Panizzi (19), carefully written by Mr. H. M. Dunstan, and edited by Mr. Fagan, who, it will be remembered, is the author of the *Life of Sir Anthony Panizzi*, which was not long ago reviewed in these columns.

Salt is doubtless as good a starting-point as another to take for a general assault on the "eccentric ideas" and "most unnatural and anti-healthy habits" of which this age is, in Mr. Boddy's opinion, "wonderfully productive" (20). However that may be, Mr. Boddy has taken it as his text for a sermon on these subjects, and written a book of nine chapters and an appendix to prove the truth of his motto, "Salt is good." We might be inclined to ask who abused it; but the writer has provided against that cavil by citing a temperance writer who has been characteristically guilty of the folly. When he has read Mr. Boddy's second chapter, showing that salt has been used and appreciated ever since the Indo-Germanic tribes entered Europe, he will perhaps have sufficient respect for evidence to change his opinion. Mr. Boddy's little book contains a good deal of interesting scientific information.

Mr. Geroldt is obviously one of the fatally numerous class who feel called upon, when accident has set them travelling over even the most beaten paths, to write their observations made in short glimpses of the surface of things in a style of feeble jocularity (21). Having gone round the world, he gives us an account of his journey, and threatens, if he is encouraged, to write again. It is to be feared that a very small amount of encouragement will be enough.

We have received a copy of Whitaker's excellent *Almanac* for 1881 (22), a work which is no longer in need of recommendation. Mr. G. Rose-Innes, junior, has published a handy pamphlet, bearing the title *Employers and Employed* (23), which gives the Employers' Liability Act of 1880 and the changes it has effected in the law.

A fourth edition has been issued of Mr. Braithwaite's useful manual (24) compiled for the use of Commissioners to administer oaths.

Messrs. Roberts and Wallace have produced a handbook (25) relating to the Liability of Employers, the laudable object of which—namely, "to weld its (the Act of 1880's) provisions into the prior law, and to give without unnecessary technicalities an intelligible sketch of the result"—has been well accomplished.

We have also to mention Mr. Macaskie's *Treatise on the Law of Executors and Administrators* (26) and Mr. Wilberforce's *Statute*

(16) *Ludwig Bürne: Recollections of a Revolutionist*. By Heinrich Heine. Abridged and translated by T. C. Egan. London: Newman & Co. 1881.

(17) *The Annual Register for the year 1880*. London: Rivingtons.

(18) *Ward and Lock's Home Book: a Domestic Cyclopædia*. Forming a Companion Volume to Mrs. Beeton's "Book of Household Management." London: Ward, Lock, & Co.

ADVERTISEMENTS.

THE GROSVENOR GALLERY.

SUMMER EXHIBITION.

Now Open daily, Nine to Seven.

Admission, One Shilling. Season Tickets, Five Shillings.

DORE'S GREAT WORKS, "CHRIST LEAVING the PRETORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 25 by 35 feet; with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORE GALLERY, 25 New Bond Street. Daily, Ten to Six. 1s.

MR. MARTIN COLNAGHI (Guardi Gallery, 11 Haymarket) begs to inform the lovers of Art that his FIFTH SUMMER EXHIBITION contains Works by the great colourist, Hieronymus Philips, called by Dominicus, the Flemish, and by the young Spanish painter, Jose Benlliure. Open Daily from Ten till Six.

AIVASOVSKY EXHIBITION,—"COLUMBUS'S SHIP IN A STORM," "COLUMBUS LANDING ON SAN SALVADOR," and many other interesting works by AIVASOVSKY, the greatest of Russian Artists. Now on View at the FALL MALL GALLERY, 45 Fall Mall. Admission, 1s., from Ten until Six.

DECORATIVE ART EXHIBITION, at the New Galleries, 103 NEW BOND STREET. Admission, 1s. Season Tickets, 5s.

FETTES COLLEGE, EDINBURGH.—EIGHT OPEN SCHOLARSHIPS. Two of £60, Two of £50, Two of £30, Two of £20. Examination in July. Candidates residing in England may be examined in London.—For particulars apply to HEAD-MASTER, Fettes College, Edinburgh.

SOMERSETSHIRE COLLEGE, BATH.—AN EXAMINATION will be held on July 13 and 14, to elect to SEVEN ENTRANCE SCHOLARSHIPS. Particulars may be obtained from the HEAD-MASTER.

ROSSALL SCHOOL.—ENTRANCE SCHOLARSHIPS. Twelve to be competed for, June 25. Value from 70 Guineas (covering School Fees) to £20. Ages under 14 and 15½. Candidates may be examined at Rossall or Oxford, as preferred, in Classics or Mathematics.—Apply to Rev. the HEAD-MASTER, Rossall School, Fleetwood.

HIGHGATE SCHOOL.—SIR R. CHOLMELEY'S FOUNDATION, 1665.—SIX SCHOLARSHIPS, £24 per annum, open to Competition in July. Further particulars on application to the Rev. the HEAD-MASTER, School House, Highgate, N.

MALVERN COLLEGE. The NEXT TERM commences Tuesday, September 27. For particulars, apply to HENRY ALDICH, Esq., Secretary.

MALVERN COLLEGE. EXAMINATION for SCHOLARSHIPS and EXHIBITIONS, December 22 and 23.—Apply to the SECRETARY.

TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON. The Warden, RICHARD CUNRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and all competitive Examinations. Exhibition to the Universities of £20 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms 50 and 60 Guineas.—Apply to the WARDEN.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

CAREFUL PREPARATION for the PUBLIC SCHOOLS, with good Church training. Ten years' experience. Large house and grounds; cricket-field, gymnasium, carpenter's room, &c.—Address, Rev. HERBERT MOODY, B.A., Allen House, Guildford.

UNIVERSITIES, ARMY, PUBLIC SCHOOLS.—A Derbyshire CLERGYMAN, M.A., Oxon., formerly Assistant Classical Master in the Charter-house, and for several years a Past Tutor in Oxford, receives a few PUPILS for the above Examinations. Terms, for boys over sixteen, £150; under sixteen, £120.—Address, M.A., the Rectory, Marston Montgomery, Derby.

CLASSICS.—An OXFORD FIRST CLASS-MAN, fifteen years of age, of Pwll, Wynn, of Pwll Square, receives PUPILS.—Address, B., 23 Blenheim Crescent, Notting Hill Station.

EDUCATION.—GERMANY, BONN-on-the-Rhine, 37 Baum-schuler Allee.—The Frläulein KUNDE receives a limited number of YOUNG LADIES. Home comforts, best masters, unexceptionable references.—For particulars apply to the above.

AN OXFORD M.A. (First Class-man), editor of Greek Texts, desires a RE-ENGAGEMENT in a Public School. Three years' experience.—Address, A. B., care of Mr. F. Bridges, Founders' Hall, E.C.

EXETER GRAMMAR SCHOOL. RETIREMENT OF HEAD-MASTER.

The Governing Body are prepared to receive applications for the Office of HEAD-MASTER of this School, as organized under the Scheme dated April 23, 1870.

It is intended that the School shall be an efficient School of Mathematical and Natural Science, and of Modern Languages and Literature; that Latin shall form a part of the ordinary course of instruction; and that Greek shall be taught without extra fee to all Scholars whose Parents or Guardians do not object to it, in such a manner as to fit them for the Universities and for holding the Exhibitions attached to the School, the aggregate value of which amounts to nearly £500 a year. The Religious Instruction given in the school must be in accordance with the doctrine of the Church of England.

The Head-Master must be a Graduate of some University within the British Empire. He will receive a fixed Stipend of £200 a year, and a Capitation Fee varying according to age from 14 to 25 for each Boy in the School. He will be required to reside in the School House, in which accommodation has been provided for Forty Boarders. He will be required to take charge of the School at the beginning of the ensuing term, which is fixed for Tuesday, September 13.

Copies of the Scheme of the Endowed Schools Commissioners, and all other necessary information, may be obtained from the Clerks to the Governing Body of the Grammar School, to whom applications (with Testimonials) must be forwarded before July 9, 1881.

JOHN DAW & SON, Clerks,
13 Bedford Circus, Exeter.

HULL and EAST RIDING COLLEGE.—WANTED, a HEAD-MASTER; must be a Graduate in Honours of Oxford, Cambridge, London, Durham, Dublin, or Edinburgh. The School will accommodate about 300 Scholars.—For further particulars apply to

ROBERT JAMESON, J.P., Hull, Chairman.
J. SANER, Jun., J.P., Hull, Hon. Sec.

THE COUNCIL of the GIRLS' PUBLIC DAY SCHOOL COMPANY, Limited, will shortly appoint HEAD-MISTRESSES for High Schools in Liverpool and Portsmouth. Salary, in each case, £250, beside capitation fees.—Applications to be sent, not later than July 3 next, to the SECRETARY of the Company, 21 Queen Anne's Gate, London, S.W., from whom further information may be had.

CONSOLS versus GROUND RENTS.—Consols pay barely 3 per Cent. Freehold Ground Rents, equally safe, pay 4 to 4½, and constantly increase in value. Descriptive Paper gratis. Sixty Lots for Sale.—Messrs. BIKER, 98 London Wall.

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel. BENJN. BULL, Manager.

THE ILFRACOMBE HOTEL is on the verge of the Atlantic, in its own ornamental grounds of five acres. It contains 200 Rooms and is "a model of sanitary excellence." One of the largest Swimming Baths in England is attached to the Hotel and is now open for the season. Cheap Tourist Tickets to Ilfracombe for Two Months from all principal Railway Stations.—Tariff and every information of MANAGER.

CRYSTAL PALACE COMPANY'S SCHOOL OF PRACTICAL ENGINEERING.—ANNUAL REA TRIP from Liverpool to London, Eight Hundred miles. Any of the Old Students wishing to participate in this Excursion for the purpose of gaining experience in Marine Engine-driving should send in their names to the PRINCIPAL without delay. The party will leave London on Friday, June 17.

F. E. J. SHENTON, Superintendent Literary Department.

RODRIGUES' NOVELTIES in MONOGRAMS, ARMS, Crests, and Addresses. Steel Dies Engraved as Gems.

NOTE PAPER and ENVELOPES artistically illuminated in Gold, Silver, Bronze, and Colours, in the first style.

BEST RELIEF STAMPING, one colour, 1s. per 100.

THE LAND BILL.

THE first night of the resumed debate on the Irish Land Bill, of which Clause 1 has at length been carried, was a good deal more instructive than might have been anticipated or than a casual hearer or reader may have perceived. Mr. FORSTER's account of the state of Ireland as viewed through the most rose-coloured pair of spectacles that the policy of his Government, in conjunction with his own unlucky honesty, could allow him to wear, appears to have reassured—as probably any other account would have reassured—his own partisans. The disturbances in the city and county of Cork had, it seems, been much exaggerated, though irregularly armed mobs to the number of some thousands did actually collect, barracks were attacked, houses wrecked, telegraph poles torn down, railway metals torn up, marines and policemen stoned. With these exceptions, no evidences of disorder exist or have existed; and, although it may require a certain exercise of ingenuity and imagination to discover the symptoms which are lacking, the fact that some are lacking is doubtless reassuring. A House thus reassured as to the immediate condition of Irish affairs could proceed to the discussion of amendments on the Land Bill with a mind much quieted and appeased. Of these amendments, two were of particular importance, both from their character and from the character of the debate upon them. These were Mr. MACNAGHTEN's proposal for setting a limit to the competition price of tenant-right, and Mr. CHAPLIN's for defining the constituent elements of the money value of that right. Both these were argued vigorously, and in the latter case with not a little heat. On the other hand, the proceedings of Tuesday's debate were almost uniformly quiet, and the acceptance and rejection of the amendments proposed took place in a manner which showed their relative importance. The Opposition were divided in their attitude towards Mr. RUSSELL's proposal to omit the specific grounds on which a landlord may reject a proposed assignal of his tenant's right. Those who opposed the omission seem to have been somewhat less well counselled than those who accepted it. Generally speaking, the objectionable feature of the Bill in all its clauses is its tendency to tie down the owner in the exercise of his rights of ownership, and any omission of a limitation is to be welcomed. Such a proposal as this, however, stands on very different ground from those just mentioned, and from Mr. HARCOURT's amendment (the chief vital amendment of Tuesday), which proposed that the difference between the actual and the "fair" rent of low-rented farms should be capitalized in favour of the landlord.

All these three amendments were stoutly opposed by the Government, and the opposition throws additional light on the real nature and objects, as well as on the probable effect, of their proposal. The rejection of Mr. MACNAGHTEN's amendment shows perhaps more clearly than has yet been shown the difference between the weight and balance which are to be used in the tenant's case and the weight and balance which are to be used in the landlord's. The essence of the measure is that it refuses to allow the latter the benefit of competition value; the essence of it also is now fully shown to be that it accords that benefit to the tenant, at least to the fortunate tenant who is in possession at the time of the passing of the Act.

Certain persons, whose intelligence is not equal to their superficial acuteness, have imagined that these two competition values, if allowed to exist, would be mutually destructive. They would be nothing of the sort. The landlord would obtain the best price for what he has to sell and the tenant for what he has to sell, and we have Mr. GLADSTONE's own authority that these are quite distinct and independent quantities. If they are so, each is independently saleable without interfering with the other. But it is clear that, if an arbitrary limit is put on the price to be obtained for the one, the overplus of value must go somewhere. It is not to be obtained for the landlord—that the Bill forbids; it is not likely to be left by the outgoing tenant as a free gift to his successor; therefore it is given to the outgoing as a gratuitous bonus. Out of this argument there is absolutely no escape, and the consequence again and again urged is finally, except in the improbable event of resipiscence on a future clause, established. The whole of Ireland is to be rack-rented in perpetuity in the shape of rent *plus* interest on competition value of tenant-right. Mr. CHAPLIN's amendment was in itself of more dubious expediency than Mr. MACNAGHTEN's. The definition of tenant-right as the value of improvements added to the sum actually paid to a former tenant is open to no objection on the score either of justice or equity. But it would have the same effect, if applied universally, of unnaturally raising the total rent of land, and thus saddling the occupiers with an intolerable burden. As a matter of fact, however, it was a valuable proposition because it once more elicited from the Government, in the form of a fresh refusal to define tenant-right, a contribution to the solution of the interesting problem as to which they are so coy. It is clear that, unless a solid slice of what is now the landlord's is to be handed over to the tenant, the very utmost which the latter can fairly claim is represented in Mr. CHAPLIN's proposal. The Government, therefore, were bound to accept that proposal, at least as a *maximum*, with provision for reduction by the Court in case the sum so fixed be obviously too large. To do this, however, would have been not merely to let their cherished cat—the nature and origin of the tenant-right proposed to be created—out of its jealously guarded bag, but to kill the animal as well. The bonus to the existing tenants at the expense of the landlords, and of all tenants (succeeding otherwise than by inheritance), which is the bait they have to offer, though they refuse to acknowledge it, would have vanished at once. The concession was therefore not merely refused, but refused with some acrimony. The narrow majority which rejected the amendment of Mr. HENEAGE on Thursday night should serve as a warning to the Ministry to avoid a too ostentatious disregard of the interests of landlords.

Mr. HARCOURT's amendment did not, like the former of those mentioned, involve a question of actual or possible confiscation. It is perfectly true that even under the Bill a landlord who at present lets his land too low (as a vast number of Irish landlords do) can protect himself up to the limit of the proposed "fair" amount by raising his rent to that sum. But, whereas Mr. HARCOURT's amendment would have enabled him to continue his easy yoke, if he chose to do so, without the danger of losing beyond recall, the rejection of that amendment makes it absolutely necessary for him, in self-defence, to rack-rent to the utmost extent possible under the new arrangements. He is told by Mr. GLADSTONE, almost *totidem verbis*, that, if he does not, he is a

and for his pains. "He cannot expect to eat his cake and have his cake"—that is to say, to eat the cake of generosity and have the cake of ownership. The law will translate his gift for him into a right. Here, again, the curious mixture of injustice and improvidence which characterizes so much of the Bill appears conspicuously. The injustice, as has been said, is not of much moment, because the landlord is furnished with a shield against its sword. But the nature of that shield is the important thing. If the Government were deliberately planning the means of rack-renting Ireland, they could not go to work in a more business-like manner or in one more calculated to effect their purpose. Having already taken means to secure that the incoming tenant shall in all cases be burdened with the heaviest possible outlay on tenant-right, they now devote themselves to securing that the landlord shall always exact the utmost penny procurable in the form of directly paid rent. The incomer is to be squeezed by his predecessor and by his landlord till not a drop more is forthcoming, and this squeezing, which is now exceptional and mitigated in the cases where it exists, will be a matter of mere business, admitting no more sentiment than the actual arrangement of the price of stocks or of cotton. Such sentiment is expressly excluded by the Government speakers, and a landlord who lets at easy rents is placed on the same footing as a broker who sells at 90½ when the market price is 90½. It is his business, and *caveat venitor*. Considering the admitted importance of the Bill and the anxiety of all serious politicians to get the question settled now that it has been raised, this attitude of blindness and obstinacy on the part of Ministers and their supporters can hardly be too much regretted.

EASTERN AFFAIRS.

IT is fortunately quite unnecessary to balance against each other the qualities or defects of the Greeks and the Turks. Captain HOBART, better known as HODART PASHA, lately assured a Conservative meeting at Portsmouth not only that the Turks were a noble people, but that, if they were fairly treated, they would be able and willing to pay their debts. A dividend on Turkish bonds would tend to revive the political sympathy which was not without reason entertained a few years ago for the nation which was then dominant in South-Eastern Europe. In the meantime those who are sanguine enough to anticipate the future solvency of Turkey will probably display their enthusiasm by buying up depreciated bonds. Captain HOBART can scarcely be regarded, as an impartial witness, since he holds the position of Commander-in-Chief of the Turkish fleet. When he first entered the service of the SULTAN he may probably have felt that he was justified in devoting his energies to the purpose of strengthening a Government which was united by common interests, as well as by positive compacts, with his own. After the misfortunes which have befallen his adopted country he may probably feel a generous unwillingness to abandon a sinking cause; but, as a general rule, it is inexpedient that English officers should engage in foreign service. It may sometimes become their professional duty to counteract the policy of their own country; and any successes which they may obtain are liable to be attributed by the sufferers to their nation rather than to their temporary employers. In the last century English admirals obtained the first victories which were won by the Russian navy. If in the late war an English commander-in-chief had defeated a Russian fleet, a dangerous resentment might have been provoked. That service under a foreign flag is not favourable to an impartial estimate of English interests and policy was proved by Captain HOBART's speech. According to his own account, he was wholly ignorant of several events, until he found on his journey from Constantinople that England was disgraced and baffled, to the great satisfaction of the statesmen of other European countries, from Prince BISMARCK downwards. If all the impressions which Captain HOBART had received, and which he reproduced at Portsmouth, had been absolutely just, it would not have been the part of a judicious patriot to publish a series of damaging confessions.

There was much truth in his political retrospect; but the intrigues of the former Russian Ambassador, the consequent Bulgarian massacres, and the partial dismemberment of Turkey are obsolete subjects of discussion. It may, as Captain HOBART says, be natural that the Turks should

resent the discontinuance of English support, and that they should have shown their irritation by disregarding Mr. GOSCHEN's advice; but it is with the Turkish Government in its present condition and temper that English statesmen have to deal. The history of the last five or six years has strongly confirmed the soundness of the policy which had been pursued by Conservative and Liberal Governments down to the time of the Bulgarian disturbances. The peace of the East was best secured by discountenancing Russian intrigues, which always tended to disturbance. The Turks were maintained in their sovereignty, not in recognition of their merits, but because they were there. They are now surrounded by hostile rivals; and peace must be preserved, if it is preserved at all, by new methods. The chances of war are diminished by the delimitation of the Montenegrin frontier, and by the reasonable arrangement which has been imposed both on Turkey and on Greece. It would seem that the SULTAN and his advisers have at last been convinced that it was better to submit to the combined pressure of the European Powers than to engage in a war with Greece, in which the stake deposited on one side would not have been balanced by any equivalent risk on the other. Greece would have retained conquests which might probably have been made; and in any treaty of peace which would have been likely to be concluded, Greece would have obtained some augmentation of territory. On the other hand, though the Turkish army might probably have been victorious, the restoration to Turkey of some part of the Greek dominions would not have been tolerated by Europe. The risk of additional complications in East Roumelia and Macedonia was perhaps also taken into account at Constantinople.

The expediency of founding political anticipations rather on intrinsic probability than on positive statements has been illustrated by the acquiescence of the Greek population in the peaceable settlement of the dispute with Turkey. In spite of repeated assurances to the contrary, dispassionate observers felt confident from first to last, that if the Turks could be induced to surrender Thessaly, the Greek Government would not hesitate to relinquish its pretensions to Epirus. The Ministers were threatened with penal consequences, and the KING himself with dethronement, if only they declined to insist on the execution of a supposed award which had been repudiated by the arbitrators. The people were supposed to be in a state of uncontrollable excitement, and the army was said to be bursting with martial ardour. It was more certain that the Opposition was prepared to supplant the actual Ministers, and that, as a preliminary step, it was anxious to goad them into irrecoverable blunders. When the Government was believed to have entered into negotiations it was accused of treason to the national cause; and if, on the other hand, it had precipitated a rupture, its adversaries would, with better reason, have held it responsible for an unnecessary war. It would be a serious imputation on the sound judgment of Mr. TRICOUPI and his political associates to express a doubt that they would have pursued the same course which they now denounce as disgraceful and ruinous. The alleged danger of popular insurrection seems to have been as chimerical as the warlike policy of the Opposition. The recruits who had swelled the ranks of the army will gladly return to their homes, and the idlers of the capital will content themselves with cheap boasts of the victories which might in other circumstances have been achieved. For the moment popular clamour is directed against the KING, who was in some degree to blame for his encouragement of warlike agitation. There can be no doubt that in his circuit of the Courts of Europe he did his utmost to obtain support for an ambitious policy, and it was by no fault of his own that he failed. Political malcontents now complain that they have derived no advantage from the influence of a King whom, as they say, the nation chose in the hope that his family connexions would promote the aggrandizement of Greece. It is not easy to understand what would be gained by transforming the kingdom into a Republic.

Attention is partially diverted from the signature of the Convention by a discreditable transaction in which some of the Ministers have been engaged. The funds of an institution bearing the ambitious title of the Bank of Thebes have been embezzled or misapplied to the amount of 30,000*l.*; and two members of the Cabinet, and some of Mr. COMMOUDOUROS's connexions or relatives, appear to have shared in the plunder. The Government endeavoured

to suppress all inquiry into the fraud; but it seems that the tribunals are sufficiently independent to institute a prosecution. The admixture of vulgar corruption with professions of passionate patriotism has many precedents furnished by the adventurers whom democracy brings into high places. In the present instance the malversation must have been contrived and executed at the time when credulous newspaper correspondents were thoroughly deceived by the apparent outburst of warlike enthusiasm. It is unlucky for the Greeks that the misadventure should have coincided with events which have directed general attention to Athens. They must console themselves with the reflection that greater States have not been always exempt from similar scandals. The character of the Greek nation has never been so remarkable for scrupulous delicacy as for general intelligence and mercantile aptitude; but it may be hoped that the culprits in the present instance are not fair specimens of the general morality. Their neighbours in Constantinople are not in a position to taunt the Greeks with their low standard of official honour. During the Russian war, which was a far more deadly struggle than any in which Greece is likely to be engaged, several of the SULTAN'S Ministers notoriously diverted to their own use sums which were urgently needed for the national defence. Some of them were probably in the pay of the enemy; and even the generals were bent rather on baffling and discrediting one another than on repelling the invader. According to the concurrent testimony of residents and travellers, the rural Turk is one of the most upright of men, while from policemen to viziers all his countrymen in authority vie with one another in dishonesty. The Greeks have not found equal favour in the eyes of English visitors to the countries which they frequent; but it is not improbable that even in Greece the ordinary farmer or rural trader may be honest and respectable. The manipulators of the funds of the Bank of Thebes probably entered the public service with the purpose of making their fortunes by the methods which they have now adopted.

THE TENURE OF LAND.

A SHORT debate on the tenure of land, arising on a resolution moved by Mr. W. FOWLER, was principally remarkable for a strong expression of opinion by Mr. GLADSTONE. It was already known that on this, as on all other questions, he inclined to the democratic doctrine; but he had not previously expressed in equally strong language his hostility to the existing practice of settlement and entail. Although the question is perhaps not yet ripe for Parliamentary action, it has long been a subject of discussion. As in all similar cases, sound theories become incensed with commonplaces and fallacies which sometimes create a mistaken prejudice against the original proposition. Mr. GLADSTONE defended Mr. FOWLER against the charge of triteness and repetition on the ground that a speech on such a subject ought not to be exclusively original or new; yet an economical reformer might advantageously dispense with arguments which have been a hundred times refuted. Lord DERBY must by this time regret that he ever made the misleading statement that the produce of land in Great Britain might be doubled by improved cultivation. If a large portion of the national wealth were diverted from more profitable occupations to the purpose of tilling the soil of England like a market garden, there is no doubt that the produce might be doubled or more liberally multiplied; but the process would be extravagantly foolish and wasteful, as it would enormously increase the cost of commodities which might be more cheaply obtained by importation. If Lord DERBY meant to say that the expenditure which might be required to double the produce would be a good investment, Lord DERBY was for once mistaken. The whole discussion is irrelevant, because there is no reason to suppose that a change in the tenure of land would encourage a large additional outlay in high farming. The Irish legislation of five-and-thirty years ago was recommended by the same assumption that the subdivision of landed property would promote agricultural improvement. The unhappy purchasers in the Landed Estates Court have not been remarkable for liberal expenditure, although they could not have anticipated that Parliament would disregard their indefeasible titles.

Mr. GLADSTONE expressed a reasonable doubt whether

the abolition of settlements would prevent the accumulation or retention of large estates. The result of a change in the law can only be ascertained by experiment; but, on the whole, the probability is perhaps in favour of subdivision. The social advantages of a large increase in the number of landowners would be considerable, but the economical benefit is more doubtful. Small estates would be tilled by small occupiers; and, until lately, it was universally admitted that agriculture, like almost all other kinds of industry, is most profitably exercised on a large scale. The further division of land among petty freeholders working with their own hands would perhaps increase the gross produce, with a large addition to the cost of cultivation. Mr. GLADSTONE contemplated a less complete revolution in recommending whatever scheme may give the greatest freedom in "the descent of land, the transfer of land, the holding of land, and the raising money on land." He may perhaps not have been aware that some of the numerous land-doctors who maintain an incessant agitation against landowners propose to prohibit the creation of mortgages and all other contrivances for raising money on land. Mr. GLADSTONE not unreasonably assumes that freedom of disposal consists in allowing men to do what they will with their own. Modern economists, notwithstanding a recent declaration of Lord DERBY'S, desire to establish the opposite principle of regulating by law every transaction of life. It may be admitted that the plan of abolishing mortgages is not a gratuitous or arbitrary device, though it involves grave interference with freedom of disposal. All modern projects relating to land affect to facilitate the outlay of capital by the owner for the improvement of the soil. As Lord SALISBURY long since pointed out, an immediate result of the suppression of settlements and life estates would be a great increase in the amount of mortgages, with the consequence of diminishing the income and resources of the owner. In the first instance borrowed money might perhaps be expended in improvements; but eventually the great majority of proprietors would be crippled by the payment of interest on debt. Small freeholders or permanent occupiers in Ireland, in India, and in almost all parts of the Continent of Europe, are painfully dependent on money-lenders. It is to prevent by artificial means the introduction of similar conditions in England that some theorists wish to prohibit mortgages. If they could persuade Parliament to adopt their views, the result would be to convert mortgage loans into ruinous transactions, where the money-lender would raise the rate of interest in proportion to the depreciation of security. It is not likely that sophistical arguments will prevail against immediate and general convenience.

There is a fundamental misconception in Mr. FOWLER'S assumption that "it is clearly our duty to get as much as possible out of our own soil." It is the clear duty, or, which comes to the same thing, the obvious interest, of every man to get as much as possible, not necessarily out of the soil of a particular country, but out of his own capital, labour, and opportunities. It is not the duty or the interest of a skilled artisan, who can perhaps earn three or four pounds a week by the exercise of his craft, to waste his time in ploughing a field or digging a garden; yet it is only by such labour on his own part or on that of some deputy that he can get the largest produce from the soil. It is not inconceivable that the whole population of a country or a kingdom might earn more by other pursuits than by agricultural labour. In a rich mineral district it might be good economy to leave the surface to itself, and to employ the strength and skill of the whole community in working the ore. In favourable circumstances a comparatively small part of the results of profitable labour would be sufficient to purchase the provisions which might have been more expensively raised by combined efforts on the soil. If the whole of England could be converted into mines, factories, and workshops, leaving a residue of labour for commercial navigation, industry and trade would be more remunerative than agriculture. In fact, more than half the population lives in towns, and never puts a spade into the ground. Farmers and farm labourers, if there were room for them in industrial occupations, might perhaps follow the same example. It is undoubtedly for the general interest that the land should be cultivated, not necessarily so as to yield the largest produce, but so as to return the greatest profit. But, for the cant of modern sophists, it might have been thought self-evident that preference for home pro-

duction is inconsistent with the doctrine of Free-Trade. A similar criticism would apply to Mr. FOWLER's simple-minded lamentation over the fact that land is, to a certain extent, regarded as a luxury. "Why," he asks, "should it be so?" and echo answers, why should jewels or pictures be preferred to more immediately useful articles? Land is treated as a luxury because it is a luxury. An owner who cannot afford luxuries is quite right in getting a fancy price for his land from his wealthy neighbour.

It is not easy to understand why Mr. GLADSTONE should sneer at Lord CAIRNS's bold and comprehensive measure for facilitating the transfer of land. He even condescended to reproduce the objections which Lord BATH was perhaps, from his own point of view, justified in raising, to Lord CAIRNS's summary mode of dealing with the rights of heirs and remainder-men. The main principle of the Bill is the power conferred on the life-tenant to sell land for certain defined purposes, on condition of subjecting the purchase money to the trusts on which the land was held. It is strange that the school of economists which habitually exaggerates the distinction between landed and personal property should object to a measure which would liberate land while it preserved residuary interests in the equivalent amount of money. The main impediment to the free transfer of land would be removed if there were in all cases a legal owner capable of giving a complete and valid title. Lord CAIRNS would, at least in many instances, supply the defect by his Bill; and if he is not sufficiently careful of the interests of heirs-at-law, it might be supposed that he was safe from the sarcasms of Mr. GLADSTONE. It is but a dull jest to taunt a Conservative opponent with being too much inclined to a Liberal doctrine. It is not to be regretted that the important controversy on the tenure of land should from time to time occupy the attention of Parliament. It is possible that prolonged discussion may tend to dissociate social motives from economic arguments. It would, perhaps, have been better that Mr. GLADSTONE should abstain from inquiries whether the proposed changes would be disadvantageous to the country. He cannot have been serious in the suggestion that the objections of the House of Lords should of necessity be met by the special creation of *majorats* in favour of peers; unless, indeed, he wished to endow hereditary legislators with a privilege so invidious that it would endanger their political existence.

THE SENATE AND M. GAMBETTA.

IT must be admitted that the defeat which the French Senate has inflicted on M. GAMBETTA has not, up to this time, had the results that seemed likely to follow from it. M. GAMBETTA has not even been able to make arrangements for a return match. He has tried to hasten on the elections, and has been conspicuously beaten in the Chamber, where he was thought to be all powerful. The means of dissolving the Chamber of Deputies provided by the French Constitution were not at his disposal. Neither the PRESIDENT nor the Senate is at all anxious to hurry on the appeal to the country; and, unless both are agreed in wishing a dissolution, a dissolution cannot be had. M. GAMBETTA's ingenuity devised a way of getting over this difficulty as regards the elections, though not as regards the meeting of the new Chamber. Though the dissolution could not take place, in the natural course of things, until October, why should not the elections be held in advance of the dissolution? The members of the new Chamber might be elected in July, though they could not enter upon their duties until October. The only inconvenience of this would be that, in the event of any sudden emergency demanding the convocation of the Legislature in the interval between July and October, it would be the old Chamber, not the new, that would answer to the call. So much, however, M. GAMBETTA was prepared to risk, and an attempt was accordingly made to get the proposal submitted to the Chamber. The different groups into which the Republican party is distributed have, one and all, declined to have anything to say to it. M. GAMBETTA had evidently reckoned without his hosts. By dint of great efforts he had got together a majority in favour of the *Scrutin de liste*. But his efforts had only given him a very narrow majority, and the vote of the Senate had furnished more than one reason why even

the members of this majority should be inclined to reconsider their decision. Somebody else had been found to take the first step in rebellion, and a refusal to enter upon a conflict with the Second Chamber is more natural, and therefore more excusable, than a refusal to pass a particular Bill. Then the apathy of the country upon the question is probably very much greater than the Republican deputies expected it to be. Either the electors do not care whether the elections are by departments or by arrondissements, or they are content to wait for the substitution of the department for the arrondissement until the new Chamber can meet in the ordinary course. Whichever of these interpretations is the correct one, the position of the majority in the Chamber is more favourable to freedom of action than they could have thought possible a fortnight ago. They may look forward to being returned once more under any circumstances, and to better things still if it should prove after all that the electors are willing to retain the *Scrutin d'arrondissement*. They can have no motive, therefore, for hurrying on the elections. They may keep their present seats for another four months, and even indulge the hope that their present seats may then be exchanged for others in the next Chamber.

M. GAMBETTA is probably greatly surprised at this sudden manifestation of independence. To be beaten even in his own section of the party, and to be beaten by large majorities in every section of the party except his own, must be a new experience to him. Even now, however, it is not certain that the vote of the Senate was a wise one. The opinions held upon this point will naturally be influenced by the estimates which those who entertain them have formed of M. GAMBETTA and M. GAMBETTA's policy. In considering how the two act upon one another, it must be borne in mind that no one, except possibly a few extreme Legitimists, believes that M. GAMBETTA's accession to power can be permanently averted. Everybody holds that at some time or other, and in some way or other, he is certain to come to the front. It is conceivable that sanguine Royalists, or even sanguine Bonapartists, may fancy that their interests will be promoted by putting off M. GAMBETTA's triumph to the latest possible date. As they hope that it will bring to a close the historical drama of the Republic, they may reasonably be anxious to have their party as strong and as well organized as possible before the curtain rises for the last act. But the Republican Senators, by whose coalition with the Right M. BARDOUX's Bill was disposed of, can have no such motive for putting things off. Much as they may distrust M. GAMBETTA, they know perfectly well that he is the mainstay of the Republican cause, and that, if he were to be tried and found wanting, the hopes of the reactionary parties would be greatly excited, and the prospects of the Republic be proportionately gloomy. Now it must appear to all reasonable Frenchmen that M. GAMBETTA's chances of political success are closely bound up with the choice he makes as regards the objects at which he aims, and the allies by whose aid he strives to attain these objects. A Correspondent of the *Pall Mall Gazette*, who appears to be very well acquainted with French Radical politics, has lately written a very informing letter upon this subject. He rejoices at the vote of the Senate because, he says, it must have the effect of reuniting M. GAMBETTA to the Radicals. Of late years, this writer thinks, M. GAMBETTA has leaned too much to the Conservatives; they are not his natural auxiliaries, and it is a pity that he should ever think, or lead others to think, that they can possibly become so. The vote of the Senate, and the distrust which under the circumstances that vote implies, must have completely cleared his mind upon this point. It makes it plain that, however much he may strain his real principles in order to conciliate the Conservatives, he will be no nearer his end. They will accept such concessions as he likes to make to them, but when all is told they will feel no more confidence in him than before. If this alleged antagonism between M. GAMBETTA and the Conservatives is real, the Senate was probably well advised in rejecting M. BARDOUX's Bill. Assuming that M. GAMBETTA can never be the leader of the Conservative Republicans, it is important to lose no opportunity of teaching Conservative Republicans to realize this impossibility. If, on the other hand, this alleged antagonism is only imaginary, the vote of the Senate may be thought unfortunate. No matter how Conservative M. GAMBETTA may be

capable of becoming, there is no doubt that he is perfectly capable of becoming something which is the very opposite of Conservative, and the question for the Senate to consider was whether by rejecting the *Scrutin de liste* they were not deciding that it should be the latter quality rather than the former which should be developed in him. It is scarcely possible for him to treat the vote of the Senate as of no account without losing the prestige which has hitherto belonged to him. He is too deeply pledged to the *Scrutin de liste* to be likely to put up with its rejection. The Senate, if left to itself, is not likely to reverse its vote. It honestly dislikes the *Scrutin de liste*, and if it can continue to reject it without danger, it will probably go on doing so; consequently M. GAMBETTA will be almost forced to propose to the electors some modifications in the constitution of the Senate. Whether these modifications are in themselves good or bad, it is highly desirable in the interests of Conservatism that they should not be proposed. It is doubtful whether the affection which the Republican party generally bear to the principle of a double Chamber is strong enough to lead them to defend it if the attack should be led by M. GAMBETTA. At all events, he himself will be committed to this attack, and all chance of gaining him over to the Conservative side will be at an end. He may not mean to go very far with the old friends into whose arms he has again been thrown, but on a journey of this kind it is not always possible for a man to say at what precise point he will stop. M. CLÉMENTEAU is alleged to have said, on hearing of the Senate's vote, that M. GAMBETTA had fallen on the right side, and the danger is that for the future M. GAMBETTA may be reduced to contending with M. CLÉMENTEAU for the leadership of the Extreme Left. No doubt if this be all that he is fitted for, the Senate has done a service to France in making him appear in his true colours. If, on the other hand, it has merely driven a force which might have been Conservative in its action into the opposite camp, the service rendered to the country will be much more equivocal. It would be rash, of course, to assume that the Senate has rejected the assistance of another MIRABEAU, but it should not be forgotten that there is this side to the vote of last week, and that it is a side that may have more truth in it than the Conservative Republicans in the Senate are disposed to think. It is only natural to suppose that in his triumphal speech at Cahors, M. GAMBETTA appealed to the party with which in the future he meant to identify himself. His intentions may prove to have undergone a very great change now that the momentary representatives of this party have contemptuously rejected his overtures.

LOCAL OPTION.

SIR WILFRID LAWSON last year persuaded the House of Commons to pass a resolution in favour of giving local communities some power of "protecting themselves from the operation of the liquor traffic." This week he has persuaded it to pass another resolution stating that it is desirable to give legislative effect to the resolution of last year. For this resolution several members of the Ministry, including Mr. BRIGHT and Mr. FORSTER, voted, while Mr. GLADSTONE voted against it. Mr. BRIGHT, while voting for it, explained that it must not be understood that he thought it desirable to legislate in a measurable distance of time on the subject. Local option can only have its turn in legislation, and its turn is a very long way off. Nor did Mr. BRIGHT pretend to be able to explain what kind of power it may be expedient or possible to give to local communities to protect them against too much liquor. He candidly said that he detested the Permissive Bill, but he would not say that some protection might not be given to local communities of a kind totally different to that which the Permissive Bill was designed to give. If any one could devise a perfectly unobjectionable scheme, then Mr. BRIGHT was willing to allow that in the far-off future such a scheme might be properly clothed with the sanction of a law. It would be equally practical to say that, if any one ever invented a system of aerial navigation, it would then be desirable that Parliament should regulate the tariffs. The House of Commons for the best part of an evening was totally out of contact with real life. It was consciously beating the air, and wasting words and time. The resolution is so entirely without

meaning that the only kind of interest it can raise is that inspired by the strangeness of a considerable number of respectable members discussing it or voting for it. The simple explanation is that the discussion and the votes were meant, not for the House of Commons, but for the Liberal constituencies. The total interest went completely for the Liberals at the last election. To reward and maintain the support thus given, members who profited by it feel that they must do something. They cannot do anything definite without countenancing some absurdity which would make them ridiculous. They cannot seriously contemplate legislation, for they cannot conceive a law which would please their supporters and which they themselves would wish to see passed. But nothing can be cheaper or easier than to come down to the House and solemnly declare that some day or other some one ought to legislate in favour of a vague principle being carried out in an unascertained way. This may seem to be a farce; but farces are sometimes, though not often, amusing, and this particular farce appears to have the merit of amusing an important section of the Liberal constituencies.

Mr. GLADSTONE, who is quite independent of the support of any one section of electors in any one constituency, made use last year of language which Sir WILFRID LAWSON recalled with natural triumph to the recollection of the House. He said that some revision of the licensing laws was inevitable, and that in this revision room must be found for some form of local option. As he did not explain his meaning, it must be a matter of mere guesswork to explain his meaning for him. But there are some senses in which local option is harmless and even just. All questions of licensing must divide themselves into questions as to the licences of existing public-houses and questions as to the granting of licences to new public-houses. Sir WILFRID LAWSON admitted that existing public-houses are, as a rule, in the hands of respectable men who honestly try to repress disorder and extreme drunkenness. Under the licensing system as at present administered, a publican who has once obtained a licence has a recognized claim to have his licence renewed so long as his conduct gives no cause of complaint. A respectable man who has embarked his capital in a business which with good conduct he may regard as permanent has an incontestable right to compensation if he is prevented from carrying on his business by new legislation. There may be some towns where there are too many public-houses, where not only proper accommodation for the reasonable wants of the public is made, but where drunkards find a new public-house every fifty yards. It would be no hardship to any one, and would possibly make the population of the place a little more orderly and respectable, if some of these superfluous public-houses were shut up. If they are shut up, their owners must be compensated, and compensation must be provided by the locality which is to be benefited by the change. It would be a purely local improvement, as much as supplying the town with gas, or water, or building in it a new bridge. If the locality is to pay, it is only right that the locality should decide whether it will pay or not. It must vote the rate on the security of which the sum required for compensation will be raised. In this sense local option is the most innocent and natural thing possible; and, if ever a Government invents a machinery by which superfluous public-houses may be suppressed on the locality providing compensation to the owners, it may be taken for granted that the locality will be consulted before it has to pay the money.

Greater difficulties present themselves when it is asked who is to say what existing public-houses are superfluous and what new houses are to have licences given them. It must be assumed that every Government and every Parliament will adhere to the two leading principles that there shall be reasonable accommodation for the public, and that compensation shall be given to the owners of houses shut up because the measure of this reasonable accommodation has been surpassed. If these principles are accepted, there would appear to be no harm in giving the locality the power of taking the initiative, and asking that a given number of houses might be shut up, a pledge being given that compensation would be provided by the locality if its wishes were carried out. The number of localities that would be willing to burden themselves with new rates in order that the public-houses in the place might be reduced to the amount necessary for the reason-

able accommodation of the community would, probably not be very great, and those localities which displayed exceptional virtue ought to be encouraged rather than thwarted. New public-houses are ordinarily proposed to be established only in localities which are themselves new, where buildings have suddenly extended, or the population has suddenly increased, or in localities where reasonable accommodation has been withheld by the decree of the owner of the soil. The locality is very greatly interested in public-houses not being set up where they are not wanted or would be a nuisance, and in having public-houses where they are wanted and would not be a nuisance. There is no reason why a locality should not have some machinery given it by which it can bring to the knowledge of competent authorities its collective view as to the expediency of not having a new public-house where the locality would suffer by its being set up or of having a new public-house where it would suffer by its not being set up. In all these senses local option may be said to be either harmless or desirable. It is needless to say that they are none of them senses in which local option commends itself to Sir WILFRID LAWSON. But they are senses in which trembling Liberal members might think they could honestly support local option when they voted for Sir WILFRID LAWSON's resolution.

AMERICA.

THE framers of the State and Federal Constitutions of America may probably not have foreseen the delays and interruptions of business for which they provided opportunities; yet it may be admitted that the practical inconvenience which results from the oversight is, for the most part, reduced to minute dimensions. There is a permanent deadlock in the proceedings of the Senate of the United States and there is a special deadlock in the election of two senators by the Legislature of New York. The Americans are, fortunately for themselves, exempt from the craze for fresh legislation which affects the English House of Commons; and consequently obstruction, however obstinate and effective, causes no serious embarrassment. The Senate of Washington has not succeeded in electing a Sergeant-at-Arms; and, in the meantime, it has done little else. After long delay the leaders of the two parties consented to go into Executive Session to consider a number of appointments made by the PRESIDENT. Some of the nominations were uncontested, and the only serious dispute related to the office of Collector of the Customs at New York. The PRESIDENT, probably at the instigation of the SECRETARY OF STATE, had dismissed the actual collector for the purpose of making a vacancy and of filling it by the appointment of one of Mr. BLAINE's partisans, who was therefore an opponent of Mr. CONKLING. Since the time of the red and blue factions of Constantinople no party controversy has been more entirely and more avowedly unconnected with principle or opinion. Mr. BLAINE and Mr. CONKLING have been rival pretenders to the lead of the Republican party; and both were regarded as possible candidates for the Presidency. Eventually Mr. CONKLING cast in his lot with General GRANT, who was at one time thought to have the best chance of the Republican nomination. Mr. BLAINE, Mr. SHERMAN, and Mr. GARFIELD formed an adverse combination, and the result proved that they had chosen the winning side. As on many other occasions, the least conspicuous of the confederates was preferred, to the great disappointment of General GRANT and his supporters. Mr. CONKLING's resentment was openly displayed by his hesitation in canvassing for the Republican nominee against General HANCOCK. His scruples were at last overcome by intimations that Mr. GARFIELD would, if elected, consider his claims to a share in the disposal of patronage. The new PRESIDENT was supposed to have afterwards confirmed his provisional assurances; but Mr. BLAINE seems to have overruled Mr. GARFIELD's conciliatory intentions. Mr. ROBERTSON, for whose benefit Mr. MERRITT was dismissed from the New York Collectorship, had been an active opponent of the nomination of General GRANT. There could be no doubt that the creation and the disposal of the vacancy were intended as slights to Mr. CONKLING. The affront was thought to be aggravated by the appointment to certain minor posts of adherents or dependents of Mr. CONKLING, although he had made no application on their behalf. As the aggrieved Senator has

been a consistent opponent of Civil Service Reform, he was not in a position to complain that the PRESIDENT distributed his patronage exclusively on political grounds.

At one time Mr. CONKLING hoped to prevent the confirmation by the Senate of the appointment of Mr. ROBERTSON; but the equal balance of parties and the schism among the Republicans transferred the decision of the question to the Democrats; and consequently Mr. CONKLING's friends thought it inexpedient to take a vote in Mr. ROBERTSON's case. The appointment was confirmed without opposition, and Mr. CONKLING, against the wish of his party, unwisely appealed to his constituents, and persuaded his colleague Mr. PLATT to offer his resignation at the same time. The experiment was the more rash because the New York Assembly had already congratulated Mr. ROBERTSON on his appointment. Mr. CONKLING's precipitate step seems to have been suggested rather by temper than by calculation. Up to the present time, though many divisions have been taken, the late Senators have never obtained more than 34 votes out of about 160; but their partisans are strong enough to prevent the election of their Democratic and Republican competitors. The English plan of electing the candidate who has the largest number of votes seems, on the whole, more convenient than the American system; but every political community is the best judge of the institutions which suit it. Even if the Senators who resigned are ultimately re-elected, the effect of Mr. CONKLING's protest will have been destroyed by the prolongation of the struggle. It is evident that the PRESIDENT's attempt to assert his independence has excited no burst of indignation, even in the State of New York. It is notorious that the modern usurpations of the Senate have not tended to promote purity or regard to merit in the distribution of patronage. A President is more likely than a Senator to prefer the public interest to the gratification of his own partisans because his patronage is larger. It is not certain whether American opinion is in favour of Mr. GARFIELD against Mr. CONKLING; but either it inclines to the side of the PRESIDENT or it is virtually neutral. The concentration of political activity on a personal dispute produces no kind of uneasiness.

As popular attention has been diverted from general politics to the squabble of the Republican leaders, and from the Senate and Congress to the Legislature of New York, it is now devoted to a small collateral issue, involving the interest which always attaches to petty scandals. The CONKLING party professes to have ascertained that a member of the Assembly, named BRADLEY, has been offered the modest price of two thousand dollars to vote for Mr. DEPEW. One of the State Senators, Mr. SESSIONS, is accused of having paid the money, which was handed over by Mr. BRADLEY to the SPEAKER. SESSIONS admits that he canvassed BRADLEY, but he contradicts the story of the bribe, which is explained by his party as an ingenious plot devised by the CONKLING faction. There is something original and spirited in the supposed advance of a considerable sum in proof of a fictitious attempt at corruption. On either assumption the reputation for purity of the New York Legislature is not exalted by the transaction. It is nevertheless highly improbable that the result of the contest should depend on bribery. Mr. CONKLING's friends were at one time anxious to hold a caucus or meeting of Republicans, members of the State Senate and House of Assembly, to determine how the party should vote; but the supporters of the PRESIDENT naturally refused to be bound by the decision of the majority; and a conference or merely consultative meeting was proposed as a substitute for a caucus. General GRANT, naturally desirous to show his gratitude to Mr. CONKLING, expressed in a telegraphic message from the City of Mexico his hope that the outgoing Senators would be re-elected. Since his return to the States he has made a speech in favour of his friend and principal supporter, with the effect of producing the criticism that he would have done well not to compromise his reputation for silence. It may be doubted whether, since his defeat in last year's Republican Convention, General GRANT retains any political influence.

The contest at Albany is managed by Mr. CONKLING himself, with the assistance of his principal adherents, of whom Mr. ARTHUR, Vice President of the United States, is the most conspicuous. It is not a little curious that the possible occupant of the Presidential chair should be exerting himself on behalf of the principal representative of the paramount claims of the leaders of the majority

in the Senate. Probably no foreigner can thoroughly understand the issues which are involved in the present contest. The party of the Administration which is opposed to the re-election of Mr. CONKLING accuses him of dividing the Republicans with the necessary consequence, if not with the purpose, of transferring his control of affairs to the Democrats. It is remarked that the secession of Mr. CONKLING and of his humble follower Mr. PLATT has left the Democrats in the majority in the Senate, and decided in their favour the important contest about the appointment of a Serjeant-at-Arms. The same politicians suggest that Mr. CONKLING must be returned, if at all, by a Democratic coalition with his Republican supporters; and that he has therefore a motive for courting the party to which he has hitherto been opposed. There is probably no foundation of the charge of party infidelity. A politician of Mr. CONKLING's rank cannot afford to desert the organization in which he has obtained power and notoriety. He has apparently overrated his own importance and influence. His resignation was offered against the wish of a Republican caucus of the Senate, and the split which he has caused in the ranks of the party in New York is regretted even by those who think that he is justified in his opposition to the PRESIDENT. It seems probable that, if Mr. CONKLING is defeated, Mr. CORNELL, now Governor of New York, will be chosen in his place by the Republican party, but it is extremely difficult to calculate on the result of any similar election. The State Senate, and House of Assembly vote under nearly the same conditions with a Republican or Democratic Convention, except that they include both parties. After numerous trials of strength, sudden combinations are formed which give the necessary majority, sometimes to a candidate who seemed to the uninitiated to have had no chance of success. Careful students of the minute peculiarities of American politics will perhaps find that the Democrats of New York, who might otherwise secure a triumph for themselves by joining with one of the Republican factions, are in turn hampered by their own internal divisions. If Mr. TILDEN, the official leader of the party, were to declare for or against Mr. CONKLING, KELLY, the manager of the Tammany organization, would defeat the arrangement by throwing his strength into the opposite scale. The merit of American politics consists in their freedom from violence and passion, and in the complicated calculations which are necessary to ensure success at an election. The main business of active politicians in that happy country seems to consist in providing mild amusement for the rest of the community. Mr. GLADSTONE, Mr. FORSTER, and their countrymen in general may well envy Mr. CONKLING and Mr. BLAINE.

SURREY COMMONS.

A LETTER from the Secretary of the Commons Preservation Society which appeared in the *Times* of Wednesday may be usefully studied by any peers who have at heart the retention of the few elements of natural beauty which the advance of "civilization" has left uninjured near London. We called attention some time since to the danger which threatened one of the prettiest districts of Surrey at the hands of the South-Western Railway Company and of a Company then striving to get born and calling itself the London, Kingston, and Guildford Railway Company. When the second reading of the Bills promoted by these two bodies was opposed in the House of Commons, it was contended, with some show of justice, that, if they were sent to a Select Committee, any objectionable elements could be got rid of, and the House, at all events, put in complete possession of all the facts of the case. It now appears that a good deal more than this is involved in the reference of a private Bill to a Select Committee. When the Report of the Committee came on for consideration, it appeared that the particular feature which had suggested the objection to the second reading had been left untouched, and Mr. CHEETHAM proposed to take the sense of the House as to its omission. Thereupon Sir WILLIAM HARCOURT started the theory that the decision of a Select Committee, though technically subject to revision by the House, ought morally to be accepted as final, and appealed to Mr. CHEETHAM not to be guilty of the unpardonable sin of wasting a morning sitting. It must be assumed that the aspect of the House gave Mr. CHEETHAM no hope of carrying his amendment. At

least it is scarcely to be supposed that he was convinced by the reasoning of the HOME SECRETARY or by Mr. TILLET's assurance that the Enclosure Commissioners were friendly to the Bill. A sitting which had kept a Surrey common for Londoners would have been an unusually fruitful one; and the Enclosure Commissioners have always held that their function is to promote commons' enclosure. The treatment of this question has greatly suffered by Mr. FAWCETT's entrance into the Government. Had he been still a private member the House of Commons would have heard a good deal more about the commons which it is now proposed to destroy. As it is, all that can be done is to make the best use of the interval which remains before the second reading of the Bill in the Lords. The Secretary to the Commons' Preservation Society urges all who care for the protection of open spaces to "use their influence to defeat this threatened injury to the public enjoyment." A good deal, however, must depend upon the action of the Commons' Preservation Society itself. There is little doubt that if the working classes could be brought to understand that the South-Western Railway Bill, while providing them with greater facilities of getting to these Surrey commons, takes care to destroy the commons in the process of making them accessible, they would do all they could to protest against the passing of this portion of the Bill. It should be made clear beyond the possibility of mistake that what is desired is not to keep these commons inaccessible, but to keep them uninjured. There can be no necessity for making the proposed branch line from Guildford to Leatherhead intersect the commons lying between these two points. They are not so extensive that it is impossible to go round instead of through them. Consequently, the only conceivable reason for giving the line its present direction is that common land costs less than private land. When a Railway Company deals with an individual owner, it has to make him handsome compensation. When it lays hands upon a common, the injury inflicted is so distributed that there is no one to whom compensation need be made. This is a very good reason for taking common rather than private land—from the point of view of a Railway Company. But, from the point of view of the London public, it is no reason at all. A Railway Company cannot take common land without the consent of Parliament, and that consent may and ought to be withheld, if it can be shown that the public injury inflicted is far greater than can be made up by any increased facilities of travelling.

Mr. FITHIAN's letter sets out very succinctly the offence of which the makers of the proposed line will be guilty. Among the commons through which it will pass is "a very lovely open space known as Great and Little Bookham Commons. They contain several sheets of water, and parts of them are as beautifully wooded as a forest." The new line will cut this space in half. What the effect of this severance will be any one who cares to pay a visit to Wandsworth or Barnes Common may see for himself. To say that it does not hurt the common is like saying that an apple does not suffer by being sliced down the middle. A common through which a railway has been carried is no more one common but two, and though two halves make a whole in arithmetic, they do not make it in landscape. The charm of a common lies in its wildness, in the lie of the ground, in the sense of space and freedom which belongs to it. If it is cut in two by a railway cutting or a railway embankment, all these merits must disappear. Its wildness will have been swallowed up by what Mrs. RITCHIE aptly calls "the shabby tide of progress." There is no sense of seclusion to be gained from the contemplation of a signal-post. Freedom resolves itself into liberty to choose on which side of the line to remain. The lie of the ground becomes chiefly interesting as giving an indication where to look for the bridge or the tunnel which enables you to pass from one side to the other if you are so minded. This question is especially a working-man's question, because no other class is so directly interested in keeping the commons within easy reach of London just as they are. If they are allowed to disappear, the only country to which working-men can ordinarily hope to have access will more and more resolve itself into a network of roads. Every year more land is enclosed, and enclosed land is more strictly guarded against trespassers. So long as the commons are protected against encroachment the county of Surrey cannot

be spoiled by this process. They are so numerous and so extensive that they must always remain a principal feature in the landscape. But if the commons are destroyed by railways, the man whose rare holiday must be spent within an hour or two of London will find that nothing is left to him but to snatch a fearful joy by disregarding the notice boards which threaten him with the utmost rigour of the law. It may be worth the Lords' while to consider whether this method of spending a happy day will be likely to increase respect for the rights of ownership or a better appreciation of the sacredness of private property in land. The temper of a man who looks upon closed woods from the turf of a common to which they give half its charm will be very different from that of the man who gazes at them from the pitiless granite of a high road or the bottomless sand of a Surrey lane. Let the South-Western Railway bring the Bookham Commons nearer to London by all means, but let it do so by taking the holiday-maker to the commons without at the same time destroying the very features which make the holiday-maker care to be taken there.

THE DISSOLUTION OF THE GERMAN PARLIAMENT.

THE German Parliament has come to the end of its uncomfortable and undignified existence. More fortunate than its predecessor, which was the victim of a penal dissolution, it has finished its legal term; but it seems to have enjoyed nothing so much during the whole period of its sittings as the announcement that its work was done, and that its members had no longer to bear the burden of being dragged from their homes to come to Berlin, and there listen, wrangle, and vote. Nothing can be more wearisome than the life of the bulk of members who come, not to support Prince BISMARCK or to oppose him, but only to support him as much as they are obliged, and to oppose him as much as they dare. On the whole, the Parliament which is now at an end has not been so subservient to the CHANCELLOR as his friends anticipated when they gloried in the results of the elections of 1860. It began by passing the Anti-Socialist law which it was called into being to pass; and eighteen months later it extended for three and a half years the operation of the law. But, even in the first flush of its enthusiasm, it was never a very pliant instrument in the hands of the PRINCE. The CHANCELLOR had always to secure the support of either the National Liberals or of the Clericals, and neither party would give its support except on conditions. The Socialist Bill was carried with the concurrence of the National Liberals, but it was stripped of some of the most stringent provisions proposed by the Government. The shops of booksellers were protected from police interference, Socialists were not to be banished from their own homes, the power of proclaiming a state of siege was limited, and electoral meetings were permitted, although Socialists attended them. The Parliament, too, has firmly endeavoured to protect its own Socialist deputies from prosecution and, to some extent, from annoyance. Still, the Bill as carried was a very strong Bill, and represented to the full the feeling of the vast mass of respectable Germans, who had been roused to indignation by the attempts on the EMPEROR's life, and were alarmed lest Germany should have to suffer what France had suffered from Communists and Russia was suffering from Nihilists. In the same way, and in accordance with the same national feeling, the Parliament willingly allowed Prince BISMARCK to obtain, in view of alleged dangers from France and Russia, a substantial increase in the German army. There has not been the slightest attempt on the part of the Parliament or of any party in it to question the foreign policy of the CHANCELLOR. When he told it to be friendly to Austria, it was friendly; when he told it to be afraid of Russia, it was afraid. The passing of the Socialist Bill and the increase of the army have been the two successes which he has obtained from the Parliament now dissolved, within the lines of the national feeling on which he has long relied, and with the concurrence of those to whom he was accustomed to direct attention as the real exponents of national feeling.

The most memorable Session of the Parliament was that of 1879, when the PRINCE broke with the National Liberals, and entered into an alliance with the Clericals in order to

set up a system of Protection. Prince BISMARCK had previously given very plain indications of what was coming. At the beginning of the year he had informed a deputation of distressed farmers, who said that they were being ruined by Free-trade, that they were perfectly right, and that he hoped with the aid of the Legislature to come to their relief. A little later, when the project of a Commercial Treaty with Austria was under discussion, the PRINCE stated that he had changed his views and was no longer a Free-trader. He privately arranged with Herr WINDTHORST the terms on which the Clericals were to give their support, and the formation of the new alliance was proclaimed by the election of an Ultramontane deputy as Vice-President of the Parliament. First a Corn Law and then a general Protection tariff were voted, after a long but ineffectual struggle on the part of the PRINCE's old friends, the National Liberals. When the final vote was taken, and a majority of exactly a hundred established a rigid system of Protection in Germany, Count von MOLTKE was seen to come forward and congratulate with unusual effusiveness the statesman who was the author of the change. Nothing could have shown in a more significant way why the PRINCE had ceased to be a Free-trader, and why Germany was added to the list of protectionist countries. In the eyes of Prince BISMARCK Protection is a purely military measure. The army costs more than Germany can afford to pay, and the Germans, as it is supposed, can be made to pay more taxes under a protectionist system than under any other. All the classes that think they are being hurt or would be hurt by Free-trade rush to Protection for its own sake, and those who have nothing to give as producers prefer to see revenue obtained from import duties, which they think they can avoid by not buying the articles on which a heavy duty is laid, rather than from direct taxes, which they must pay in any case. There is not the slightest reason to suppose that the Parliament misrepresented the wishes of the nation, or that the new elections will strengthen the Free-traders; and all over the Continent it may be seen that big armies and Protection go every year more necessarily together. The price of the alliance of the Clericals was paid in the Prussian not in the German Parliament. In face of a strong Liberal opposition it was not so heavy as had been anticipated. The FALK Laws were modified, but they were only modified in the sense that, within somewhat narrow limits, the Ministry was authorized, if it saw fit, to relax them. The Clericals were put on their good behaviour, and the laws were to be severe or lax according as the party pleased the CHANCELLOR or not. They were only very partially satisfied with the result; and, although they have not subsequently quarrelled with the CHANCELLOR, they have felt a pleasure in thwarting him so far as they could do so without making him an open enemy.

When once the Socialist Bill, the increase of the army, and the institution of Protection, have been enumerated, we have come to an end of the triumphs of Prince BISMARCK in his dealings with the Parliament. The main history of the Parliament has been a history of small quarrels with the PRINCE. The list of proposals made by the PRINCE, and either rejected or emasculated by the Parliament, is a long one. It would have nothing to do with his gagging Bill, with his tobacco monopoly, or with his strange project for setting up a German South Sea Company. It has nearly driven him wild, as he himself said, by its constitutional pedantry in criticizing his scheme for absorbing Hamburg in the Customs system of the Empire. Within the last few weeks it has positively refused to vote a farthing for the expenses of an Economical Council which he chose to invent and call together to form in financial matters a Parliament outside Parliament. It has taken the pith out of his recent semi-Socialist measures. It has made his device for resuscitating mediæval guilds harmless by making it optional; and his project for a vast central insurance office against accidents in which the State should pay for the poor has been turned into a scheme for an insurance office in each separate State, employers and employed being alike obliged to contribute; and the State giving no help to the poor. It might seem that a Parliament that has shown this amount of independence would at least have the satisfaction of respecting itself, and would take a pride in having shown that it had resisted pressure and striven to do its duty. But the members of the German Parliament do not find satisfaction or pride in anything. They simply

hate their life, and business is often at a standstill, because they will not come to Berlin. Their life is a life of incessant wrangling, party manœuvring, and exposure to bullying or menace. Sometimes Prince BISMARCK will not come near them; sometimes he treats them to a violent harangue, in which the mildest thing he ever says is that they cannot be so sick of him as he is of them; sometimes he amuses himself by walking away directly a member to whom he objects begins to speak; sometimes he threatens to carry off the whole pack of them to Hesse Cassel. On the other hand, they can sometimes prevent his doing all that he wishes. This is, no doubt, a consolation to them as honest men; but it is scarcely a sufficient consolation to compensate them for leaving their homes.

VACCINATION AND SMALL-POX.

THE Local Government Board have published a very useful Memorandum, by their Medical Officer, Dr. BUCHANAN, on the number of deaths from small-pox among vaccinated and unvaccinated persons respectively. It is not to be expected that any amount of evidence upon this point will convince the sworn enemies of vaccination. They have renounced the Public Vaccinator and all his lymph, vaccine and human; and they are probably happier in dying for their faith than in living by a cowardly denial of it. The class to which information of this kind is really valuable is that margin of indolent or unreasoning persons who have not made up their minds to let their children go unvaccinated, but who are willing to avoid the trouble of taking them to the doctor, and so listen, half-convinced and half-doubting, to any arguments which go to show that they had better keep them at home. The figures brought out by Dr. BUCHANAN are very well calculated to startle these people into common sense. If a million of unvaccinated persons were living on one side of the Thames and a million of vaccinated persons on the other, the number of deaths from small-pox during the last fifty-two weeks would have been in the former million 3,350 and in the latter 90. If the selected millions were made up of persons under twenty, the deaths from small-pox in the unvaccinated million would have been 4,520 and in the vaccinated 61. Limiting the comparison to children under five, the deaths would have been 5,950 per million among the unvaccinated and between 40 and 41 per million among the vaccinated. To put the same facts in a different shape, there are 37 chances that you will die of small-pox if you have not been vaccinated to one chance if you have been vaccinated. If you are under twenty, the chances are as 74 to 1, while with children under five they are as 146 to 1. In presence of these figures it is idle to complain that vaccination does not afford perfect protection against small-pox. Even the smallest proportion, 37 to 1, affords sufficient reason for taking the precaution which leaves you only one chance of dying by small-pox instead of 37. It would be well if the local authorities or the Government would take means to have these calculations made widely known. They ought to be given to every person who registers the birth of a child, scattered broadcast in house-to-house visitations, and have a conspicuous place found for them among parochial notices on church doors and elsewhere. If they were printed as leaflets they might be in the hands of every clergyman, every dissenting minister, and every district visitor. The greater the publicity secured for them the greater is the chance that they will take real hold of the class for whom they are intended.

There is another lesson which Dr. BUCHANAN's Memorandum conveys, and that is the tendency to decline which is apparent in the protective power of vaccination if it is not repeated after childhood. Supposing there has only been one vaccination, the security against small-pox is, as we have seen, very much greater in the case of infants under five, and considerably greater in the case of persons under twenty, than it is in later life. But this security can be regained in all its force by revaccination. The statistics relating to soldiers, sailors, postmen, and persons employed in small-pox hospitals fully bear out the inference which is suggested by Dr. BUCHANAN's figures. If it were possible to make revaccination universal, there seems good reason to believe that small-pox would become of almost as rare occurrence in England as the plague. Unfortunately this end can only be brought about by indirect means.

We have not yet succeeded in making the vaccination of infants really compulsory—in other words, we do not, as the anti-vaccination fanatics put it, snatch the infant out of its mother's arms and hand it over to the vaccinator to be operated upon. Yet where children are concerned the argument for vaccination is even stronger than it is where adults are concerned. The man who refuses to be vaccinated risks death from small-pox in his own person. If he is the sinner, he is also the sufferer. But when a man refuses to have his child vaccinated, the infant suffers for the parent's folly, and the law rightly holds that there are many dangers which a man may incur for himself and yet may not compel others to incur. Apart from this, the difficulty of enforcing vaccination in the case of adults generally would be practically insurmountable. The only thing that can be done in this direction is to extend the practice of making revaccination a condition in all cases where the State has something to give and may consequently demand something in return. Soldiers, sailors, and postmen are now revaccinated; and we do not see why this condition should not be extended to all Government employments whatever and to all recipients of poor relief. The community has a right to make its own terms in distributing its own money; and, if a man or woman cannot support themselves, they have no right to complain if the State stipulates, before taking their support upon itself, that they shall not become common carriers of a highly infectious disease. It seems vain, however, to hope for any advances in this direction while Boards of Guardians are so remiss, and are allowed to go on being so remiss, in seeing to the vaccination of children. In Bethnal Green, for example, a house-to-house visitation has shown that there are 828 unvaccinated children in the parish. The number could not possibly have been so large if the same care had been taken to carry out the law before the present epidemic began as is being taken now that the prevalence of small-pox has been forced upon public attention. In Hackney it is stated that a number of parents have refused to have their children vaccinated, and that the Guardians have resolved to prosecute one of them. This is not a case to which the principle of a test prosecution can possibly be applicable. The law is perfectly clear, and proceedings ought at once to be taken against every person found breaking it.

It is not often that we are able to sympathize with the managers of the Metropolitan Asylums Board, but they do at last seem to have got hold of a genuine grievance. At their last meeting Sir E. H. CURRIE gave a really piteous account of the difficulties they have had to contend with in connexion with the hospital ship offered them by the Admiralty. To most people it will seem that a ship moored in the middle of the Thames is about as isolated a place as can well be found in the neighbourhood of London. But nobody who has anything to do with the river seems willing to look at the matter in this light. The Port Sanitary Authorities and the Thames Conservancy, instead of helping the Asylums Board to get their ship ready, are doing all they can to put obstacles in their way. The directors of a Company which owns a disused pier have consented to let it to the managers, but another Company which has its premises near to this pier has declared that it will "move heaven and earth" to prevent the managers from using it. Moving heaven and earth will probably resolve itself into moving the Chancery Division to grant an injunction, but we shall be greatly surprised if any judge is found to sustain so unreasonable a request. The objection to gathering large numbers of small-pox patients together in an ordinary hospital is that the danger of infection which is inseparable from such a hospital ought not to be vicariously imposed on two or three districts. When the hospital is placed on the river this danger may, with proper precautions, be reduced almost to nothing. Every parish in London will gain from having its small-pox patients removed from its borders; while, as the Thames is, from a sanitary point of view, extra-parochial, no parish will suffer from patients not its own. We may be permitted perhaps to remark that Sir E. H. CURRIE unintentionally made an excellent point against the system of aggregate hospitals when he said that the small-pox patients removed from Hampstead to a hospital in some distant district were almost dead when admitted, owing to the long journey which they had had to take. Why should not this be equally true of small-pox patients removed from a distant district to Hampstead? It is one advantage of the system of hospital ships that

the Thames, at one part or other of its course through London, comes fairly near to a large part of the metropolitan area; and that, if patients were embarked in a steam-launch at the nearest point, their journey would be much less fatiguing than it can possibly be made in a land ambulance.

DULWICH COLLEGE.

A BEAR garden in Southwark and the Fortune Theatre in Whitecross Street laid the foundation of the fortune of Edward Alleyn the actor and pious founder of the College of God's Gift at Dulwich. With the same keen business instinct which had been the means of raising him from comparative poverty to wealth, he invested the money he had accumulated from these two sources in the purchase of the Dulwich estate. Even in those days, when London scarcely stretched southwards beyond the river's bank, and when Dulwich lay embedded between thickly wooded hills where gipsies and vagrants of all kind found undisturbed resting-places, the property was a valuable one; and to its shaded groves Alleyn was wont to retire when wearied by baiting bears for the amusement of the King, or by earning the plaudits of the citizens at the Fortune Theatre.

But while enjoying the quiet seclusion of Dulwich Alleyn did not shut his eyes to the wants of the poor about him, and he determined to build and endow a college on the spot, in which should be housed and fed six old men and six old women to be chosen from among the deserving poor of Camberwell, St. Saviour's, Southwark, St. Botolph Without, Bishopsgate, and St. Luke's, Middlesex, and where twelve scholars from the same parishes should be taught "writing, reading, grammar, music, and good manners." A master who was to be of the same blood and surname as himself, and who was to enjoy in virtue of his office passing wealth on 40*l.* a year, besides a table allowance and two hundred faggots of wood; a Warden, and four Fellows, were to constitute the staff of the College. With all the loving zeal of a founder Alleyn watched and superintended the daily growth of the College walls, and on the completion of the building, in 1619, he presided at the inauguration dinner at which the Lord Chancellor, Sir John Bodley, and a host of notable personages partook of the "neats tongues," "godwits," "felde pigeons," "Colley floreys," and other delicacies which were provided for their entertainment.

As long as he lived also he administered the affairs of the College himself, and at his death, in 1626, he bequeathed the estate, as it at present exists, for the support of the charity. For more than two hundred years the affairs of Dulwich College remained much as Alleyn left them on his death, except that the value of the property had in the meanwhile increased from 800*l.* a year to a sum more than twelve times that amount. It is obvious that this vastly increased revenue was far more than was necessary to provide for the moderate objects of Alleyn's charity, and it needed no great insight into such matters to be aware that "where the carcase is there will the vultures be gathered together." The case was eminently one for the consideration of the Charity Commissioners, and the attention of that body having been called to the matter, some four-and-twenty years ago, they pounced without hesitation on the abuse, and began their reforms by dragging their victim into the light of day. After much consideration and lengthy inquiries, they framed a scheme which, while preserving the lines laid down in the original bequest, provided for their enlargement in proportion to the elasticity of the income. Bearing in mind Alleyn's statute, that those scholars who were "unfit for the University" should be instructed "in their several manufactures"—in other words, be fitted for trade—they established a lower school for the poor and industrial classes, where, for a fee of 1*l.* a year, a thoroughly good, sound education was to be given, and to which was apportioned 720*l.* a year for exhibitions and gratuities for the most promising boys. By means of these exhibitions they linked the Lower school with an Upper school, which, according to their intention, was to become a first-rate public school, and to this they assigned 800*l.* a year for exhibitions, and about 2,000*l.* for scholarships tenable in the school. In both schools priority of entry, and of possession of scholarships and exhibitions, and a reduced scale of fees, were reserved for boys from the privileged parishes—that is to say, St. Botolph's, where Alleyn was born; St. Luke's, Finsbury, and St. Saviour's, Southwark, where during a quarter of a century he followed his profession as an actor; and Camberwell, where he lived during the last years of his life, where he established his charity, and where he died.

How completely this scheme was in accord with the requirements of the district is proved by the unqualified success it met with from its first adoption. No sooner were the Master, Warden, and Fellows pensioned off, and a Master, who was something other than a drone, with a working staff, appointed in their room, than boys poured in to both schools at such a rate that the old College could not hold them, and it became necessary to provide a new building for the overflow. The existence of a thoroughly good system of education both for those "fitted for the University" and for "poor scholars," to quote the words of Alleyn's statute, added an attraction to the natural charms of Dulwich, and the Governors were soon besieged with applications for building leases. Row after row of houses sprang up on the estate, serving the double

purpose of adding to the number of scholars, and at the same time of more than providing the additional means necessary for their education. Thus things went on until at the present time the limit of six hundred boys for the Upper school and two hundred for the Lower school has been reached, while the income of the estate has advanced from 10,000*l.* in 1857 to rather more than double that amount.

It might have been thought that the success of the scheme would have been accepted as a sufficient justification for its existence; but as a matter of fact its success has continually laid it open to attack. The wealth added to the estate by the settlement at Dulwich of parents desirous of sending their sons to one or other of the schools excited the cupidity of the vestries of the other privileged parishes, who began to clamour loudly for the partition of the Dulwich estate and for an appropriation to themselves of three-fourths of it. Of these claims the Endowed Schools Commissioners wrote:—"The vestry of St. Luke base their claims on the assumption that the four parishes have equal beneficial interests in Alleyn's foundation, and that this interest is for each parish one-fourth of the whole. The Commissioners desire to state that, in their judgment, this argument is not supported by the true interpretation of the instruments of foundation or by the facts of the case. There is, therefore, in the opinion of the Commissioners, no ground for the division of Alleyn's endowments into four equal parts—one for each of the four parishes—and in this opinion they are confirmed by the circumstance that, although this endowment has been many times subject to hot debate before the Archbishop of Canterbury as visitor, before the Court of Chancery, before the Charity Commissioners, and before Parliament, no one of these authorities has recognized such a view. On the contrary, their decisions and actions have been entirely inconsistent with it."

Notwithstanding this, however, the vestries were so persistent in their outcry that in 1872 the Charity Commissioners drafted a new scheme, in which they proposed to give to each of the three claimants a capital sum of 10,000*l.* for educational purposes and a capitation allowance of 1,000*l.* a year. Fortunately this scheme never got beyond the abstract stage of discussion; neither did one published in February 1874, by the terms of which St. Saviour's and St. Botolph's were each to have 10,000*l.* and St. Luke's 20,000*l.*; nor yet did one brought out later in the same year, by which 15,000*l.* was to be paid to St. Saviour's and 50,000*l.* to St. Botolph's and St. Luke's. In the years 1875, 1876, and 1878 fresh schemes of a somewhat similar tenour were proposed, and were all in turn withdrawn in obedience to law and common sense.

With a pertinacity, however, which is only equalled by that of the St. Luke's Vestry, the Commissioners have now again returned to the charge, and have drawn up an elaborate scheme for the administration of "Alleyn's College of God's Gift and the endowments thereof." It is possible that the uncertainty engendered by repeated attempts at legislation, and the personal animosities produced by the unfortunate "Dulwich Libel case," have made some new arrangements advisable. But the case is one to which the doctrine of *cy pres*, as followed by the Commissioners in 1857, is eminently applicable. Since that date nothing has occurred in the circumstances of the case to make it either necessary or reasonable to reverse the principle upon which they acted. The only changes which have taken place have been a considerable increase in the population of the parish of Camberwell as a whole, and the Dulwich part of the parish in particular, with a corresponding inflation of the revenues of the College, and a gradual decrease in the populations of the other three parishes. In 1851 the population of Camberwell was 51,000, in 1871 it had risen to 100,000, and is now probably not far short of 200,000; in 1861 the population of St. Saviour's, St. Botolph's, and St. Luke's parishes were respectively 19,000, 11,569, 57,000, as against 15,000, 6,100, and 54,000, in 1871. In view of these facts, the policy of the Commissioners should have been to strengthen the educational system existing on the spot, and to make it more effective and far reaching by linking together the Board and other schools of the parishes with the Lower school, and this again with the Upper school and the Upper school with the Universities by an enlarged system of scholarships and exhibitions. But what do they propose in the new scheme which they have drafted? Amongst other things, they propose to give to the three diminishing parishes a capital sum of 65,000*l.* out of the Dulwich estate, with an additional annual income of 1,500*l.*, to be applied to educational purposes, while Dulwich College is to be satisfied with a capital sum of 3,700*l.*, and an annual income of 3,900*l.* The Lower school is also to receive 12,000*l.* for new buildings, with an annual income of 1,000*l.*; and 6,000*l.* is to be appropriated for a girls' school, which is to be further supported by an annual grant of 500*l.*

These figures are sufficiently startling as they stand; but they by no means limit the liberal intention of the Commissioners towards the three northern dwindling parishes; for they expressly provide that in the distribution of any future accumulation of income arising from the Dulwich estate, regard shall be had "to the just claims of the four parishes of St. Giles, Camberwell; St. Saviour, Southwark; St. Botolph Without, Bishopsgate; and St. Luke, Middlesex." According to a Report published of the proceedings of a deputation from Camberwell to the Commissioners, this point was strongly commented upon by Mr. Grantham, M.P., who introduced the deputation; and the only answer vouchsafed by Sir Samuel Fitzmaurice was that "the present Com-

Commissioners had nothing to do with that, as the consideration of any such claims would be taken off their shoulders and put upon those of the Charity Commissioners of the future! It is to this happy-go-lucky principle of making things smooth at the moment, and allowing the future to take care of itself, that the strange provisions of the present scheme are probably to be attributed. On no other ground is it possible to explain the proposal to hand over 50,000*l.* to the already charity-gorged City parishes of St. Botolph and St. Luke. Mr. Bryce, in moving the second reading of the "London City (Parochial Charities) Bill," lately asserted in the House of Commons that the charity funds annually distributed in the City parishes average at the present time 2*l.* per head of the inhabitants. But, according to the recent Census returns, the population of the City is only a third of what it was at the beginning of the century; and, if it continues to diminish at the same rate, there would be at the end of fifty years, if the charities were left undisturbed, a very appreciable addition to the income of every resident derivable from the charity funds. Even now there is such a plethora of money that, to quote Mr. Bryce, a great deal is spent in the "payment of poor rates, to the relief of the great banking houses and public warehouses in the City."

But the time chosen for the transfer of the money is as unwise as the gift itself. The Parliamentary vultures are already hovering over the City preparing to pounce upon its charities; and yet this is the time chosen by the Commissioners to pay over 50,000*l.* into the doomed funds. Mr. Bryce has shown conclusively that, so far from wanting money, the City parishes, St. Botolph and St. Luke among the rest, are in need of depletion, and it requires no gift of prophecy to foresee that before long the surplus moneys, including the Commissioners' 50,000*l.*, if they should be permitted to carry out their scheme, will be scattered by Parliament to the four winds of heaven as occasions may arise for their distribution. In short, reason and fact point to the conclusion that the parishes of St. Botolph and St. Luke have no right to the money, and that they have no need for it, and further that, if it were given them, it would be immediately taken from them.

After what we have said, we shall probably not be thought presumptuous if we take it for granted that the Commissioners' scheme will not become law. But, as we have pointed out, it may in the circumstances be advisable to revise the scheme which has governed the College and its endowments for the last twenty-four years, and we have indicated the direction which the revision should take. Ample provision should be made to secure the permanent existence of the Upper school as a first-rate public school, and there should further be devised a liberal system of scholarships attached to the schools in the privileged parishes to enable those boys who are fitted for a higher course of study to enjoy the privileges of the best possible education.

SKIRMISHING AT LIVERPOOL.

ALTHOUGH there cannot be said to have been anything particularly novel about the attempt to blow up the Town Hall at Liverpool last week, it must be allowed a considerable position among like displays of Irish valour, forethought, and resolution. As usual, it is entirely impossible for persons in possession of minds of ordinary sanity to understand the exact object which the conspirators proposed to themselves. By placing a bomb or petard against a door you can certainly, if you manage properly, blow in that door, but you cannot do any very great damage of any other kind. You may kill a few passers-by, it is true; but passers-by at four o'clock in the morning are not numerous, nor, as a rule, are they either important or personally obnoxious by station or office. In the second place, the absence of personal valour on the part of the skirmishers was also, as usual, conspicuous. It cannot be too much urged on the managers of the Skirmishing Fund in future that the arming of their mysterious avengers with weapons of price and precision is an altogether useless expenditure of the money obtained from the housemaids of New York. The skirmisher's first duty is to run away, and that he does nobly; but he appears to consider that the principal object of carrying arms is to enable the carrier to allow himself to be disarmed. The mild and sheeplike demeanour of M'Kevitt and M'Grath does not of course in the least detract from the credit due to the admirable conduct of their countryman, police constable Casey. An unarmed man who captures one armed with a revolver, and possessing himself of that weapon makes a second scoundrel stand and deliver his weapon, performs what may be called with appropriateness a very pretty feat of arms. The policeman who dragged the infernal machine away from the door perhaps showed greater pluck still, and we are not disposed to cavil, as some very critical persons have done, at his discretion. Discretion is an admirable quality, perhaps rarer in its best form even than courage; but it has forms which are not its best, and which may be confounded with that best with great convenience to the individual but not to the advantage of society. It was very clearly the duty of police constable 884 (we are sorry that his name escapes us) to get the infernal thing away from the door first of all. In the words of Colonel John Hay, that duty was "a damned clear thing, and he went for it there and then." If all persons who have to do at the present moment with Irish scoundrelism saw their duty quite as clearly and went for it with quite as much decision, it would be a good deal better for them and for the public.

The story, however, commonplace as it would be but for the excellent pluck and judgment of the police and the successful capture they made, has a kind of *code* or afterpiece, which seemed from the first as if it must be legendary, but which might have been true (it is not stranger than the Chester Castle business), and at any rate is too picturesque to be lost. The captured scoundrels were brought before the magistrates, remanded, and placed in the borough gaol in one of the suburbs of Liverpool. About two o'clock on Sunday morning (so ran the legend) a body of some three hundred men, in marching order, approached the walls of that accursed bastille. It is observable that the practice of keeping step always figures prominently in Irish disaffection. Whether it is the chorus of the *Marseillaise* which is responsible for the idea, we cannot say, but all leaders of revolts in Ireland seem to imagine that, if some hundreds of men can be got to do "left-right" about the country (especially in the dark), the brutal Saxon will vanish from the land, and the days of Malachi with the Collar of Gold will return. So the forlorn hope of Liverpool marched. But when they came in sight of the gaol an unpleasant surprise awaited them. "The warders were armed," as Mr. Kinglake (with only one word altered) observed in the passage which grieved Mr. Matthew Arnold so dreadfully years ago, as a proof of the brazen and Corinthian character of English style. The rescue or two which was coming up, therefore, said to each other, like the counsellors of Frederick the Great's ancestors, "*Que faire ? ils ont des canons*," and made off in several directions. For a county constable had seen them marching, and it had struck him that two or three hundred people, evidently not in Her Majesty's service, had no particular business to march at two o'clock in the morning. So the mythical rescue failed, as, let us hope, it would have failed if it had been attempted, and M'Kevitt and M'Grath languish in prison, objects doubtless of the most fervent sympathy to the New York housemaids. It does not, however, appear that the employers of the New York housemaids feel exactly the same sentiments. Americans, despite the nonsense which is talked by some sentimentalists, are still not very fond of England, and would probably grieve but moderately at an English defeat in regular warfare. But they have no more affection for the skulking murderers whom by no fault of their own they harbour, and send back to us, than have Englishmen themselves. The reported utterances of O'Donovan Rossa are of course valuable only in so far as the reader has the wit to interpret them rightly. When Rossa says that he knows nothing of M'Kevitt and M'Grath, his denial is worth exactly the amount at which he sets his knowledge. When he, denying that the act is directly Fenian, admits that it grew out of the spirit animating the Fenian organization, the admission is so far valuable that it shows that Rossa knows unqualified denial to be useless. It is clear, however, that the skirmishing fund is not one of those American products of which America is most proud. The Americans, judging us by themselves, naturally think that this sort of argument is more likely to harden than to soften the hearts of Englishmen towards Ireland, and it is by no means clear that they have any interest, or think that they have any interest, in Irish discontent as such. The "Irish vote" is quite as much of a nuisance as it is of an advantage, and Americans proper resent the tendency of Milesian colonists to look on America merely as a place wherein to amass a little money to purchase a farm in Ireland. Also the shrewder inhabitants of the States know quite well the difficulties which they have before them, and anti-rent crusades and secret societies provoking to outrage are not things at all likely to conciliate them.

For us, however, the important thing is not the attitude of the Americans, but the probability of these abominable outrages continuing and the best means of dealing with them. Mr. O'Donovan Rossa was reported to have said that he knew all about the *Doterel* explosion, that infernal machines of some sort or other had been placed in her hold, and that Irishmen in the navy had undertaken more projects of the same kind. It has already been remarked that nothing acquires probability from the mere fact of Mr. Rossa having testified to it, but that things antecedently probable may be made less improbable still by his corroboration, provided that there is no other likely explanation. The official inquiry into the loss of the *Doterel* has not been held, and we are, therefore, under some restraint in commenting on that disaster. But Commander Evans's report frankly declines to give any but the most hypothetical explanation, and conjecture is, therefore, to a certain extent free. In Monte Video, we are told, they incline to the hypothesis of Chilean torpedoes—a not impossible, but somewhat unlikely, theory. The boiler theory, which official opinion is believed to favour, implies very bad management on the part of the engineers. The infernal machine explanation, whether it gains or not from the respectable endorsement of Mr. O'Donovan Rossa, was notoriously a favourite one at the time of the disaster, and certainly does not lose credit when it is taken in connexion with the repeated attempts (more clumsy, indeed, but made under more difficult circumstances) at similar atrocities on land. It would be altogether idle to pretend that any Englishman, except a Ministerial partisan who has resolutely stopped his eyes and ears, is at a loss to account for the abundance of this class of outrages. They were, it is not too much to say, indicated and trade-marked by Mr. Gladstone in his famous Midlothian crusade, as the special and infallible means of inducing Englishmen to change their minds on a political question. The very clearness and certainty with which this fact is known has been of some service to the Prime Minister's henchmen in their

attempts to discount the damaging inference. That inference was made known so early, has been pointed out so often, that it is easy to deride the repetition of it with the cry of "connu!" It may be submitted, however, with all submission to these ingenious reasoners, that after all it is no argument against an hypothesis that it constantly explains constantly recurring facts. In the Fenian outbreak of a dozen years ago the use of explosives was comparatively rare—in the present business it has been constant. The alteration cannot be explained by the progress of science, for the attempts made recently have not been by any means specially according to knowledge. It cannot be explained by any immediate and pressing object not to be obtained in any other way; for neither at Salford, nor at London, nor at Liverpool, nor in any of the other instances, has there been any such object to be aimed at. The simple fact is that the indiscretion of a prominent statesman, accustomed to ignore everything but the direct object at which he is aiming, has put into the heads of divers rather stupid and absolutely unprincipled persons the idea of bullying Englishmen into submission by doses of gunpowder and dynamite. What is more, the idea has been caught up by partisan journalists and speech-makers; and it is being urged on Englishmen that the only way to stop the gunpowder and the dynamite is to grant Irish demands without looking at the bill. Of course, the question for the constituencies and for the public generally is whether this system commends itself or whether it does not. A person of the exact type of the celebrated "man in the Peckham omnibus" was heard the other day to murmur that "in his opinion these two fellows meant murder, and he did not see why they should not be treated as murderers." This was, of course, shocking, and can only be set down to the incurable brutality of the English middle class. But, at the same time, it is quite certain that "when the Danes land" there are only two things to do. You may buy them off, in which case they will go on landing until your purse is empty and your throat has to pay the penalty of the emptiness. Another method is to meet controlment with controlment—to give seven feet of English rope to every rascal who is found endangering the lives of innocent men, women, and children in England by his clumsy scoundrelism, and seven volleys (though seven would hardly be required) of English lead to every gang of rioters whose operations in Ireland are intended to be aided and abetted by the said scoundrelism. The Danes have landed now in Thackeray's sense, and the question is what is to be done with them. All the nonsense talked about tyranny and repression and Continental precedents need not for one moment disturb any one who reflects that, in a political point of view, Ireland is absolutely free; that not one single vestige of what is called, in political slang, ascendancy remains; and that, if those who arrogate to themselves the title of Irishmen are fighting to-day, they are fighting only for the privilege to murder and maim, to shut up free markets and forbid the free exercise of personal rights, to refuse the payment of just debts, and enforce the obedience of illegal dictation.

DESTRUCTION OF THE CITY CHURCHES.

THE *St. James's Gazette* of Monday last favoured its readers with what it calls "a census-table of a rather remarkable character which will not be found in any official return," though it studiously omits to specify by whom or for what particular purpose this unofficial census was taken. Some conjecture however may be formed on both points from what is stated further on. This census was taken on Sunday, May 1, and professes to show how many persons of either sex attended morning service at the various Churches and Nonconformist Chapels in the City on that day exclusive of choristers and other officials, what number these buildings will accommodate, what is the income of the clergy attached to them—we are told nothing about the incomes of Dissenting ministers—as well as "some other detailed information of an interesting and surprising character"; not very surprising, we should imagine, to those at all familiar with the subject. On these "interesting figures" the *St. James's Gazette* proceeds to observe that "many good Churchmen" are discontented with the present state of things, especially when they come to reflect that the City population is rapidly decreasing, while "new populations are crowding the suburbs, where sufficient church accommodation can only be supplied by constant demands on their pockets;" and these good Churchmen would accordingly like to see all or most of these churches swept away, and their incomes and ministrants transferred elsewhere. But we are particularly requested to direct our attention "to the returns of attendance at the Nonconformist Chapels on the same day; from which it appears that the total general congregation in 15 chapels nearly equalled the congregations in the 57 churches." It would not perhaps be uncharitable to assume that the census was conducted under Dissenting auspices and with a view of establishing this "interesting" contrast, and it is obvious at once to remark that, as a test of the relative strength of Church and Dissent, it is open to all the same objections which have been repeatedly urged in our columns and elsewhere against the trustworthiness for that purpose of the official census conducted in the same manner throughout England by Mr. Horace Mann in 1851, which the Nonconformists have resolutely refused ever since to allow to be corrected by a more accurate system of computation. But there are still further objections to the suggested inference in the present case, and as the relations of Church and Dissent have very little to do with

the general scope of our argument, we may as well dispose of this aspect of the question at once. In the first place then it must be observed that, if these 15 Nonconformist chapels can secure an aggregate attendance nearly equal to that of the 57 City churches, it looks as if the small numbers at some of these last must be due rather to clerical neglect or some other accidental cause than to any want of people to come, and it can at best afford no better reason for demolishing the churches in the City than in many parts of Wales where at least three-fourths of the people attend Dissenting chapels. But in the next place "these interesting figures" show that of the total congregation of these 15 chapels a full third is monopolized by the City Temple, which not only stands at the very outskirts of the City, but from the peculiar style of preaching affected by Dr. Parker—on which we had something to say in another connexion not long ago—notoriously attracts a miscellaneous audience from all parts of London. Of the remaining two-thirds a good deal over half is absorbed by the Finsbury, South Place, and Weigh House Chapels, which are three of the largest and best known in the metropolis, the latter especially, where Dr. Binney used to preach. The only other Nonconformist congregation reported to exceed or nearly approach 300 is that of St. Mary Moorfields, formerly Cardinal Wiseman's Pro-cathedral, and the oldest Roman Catholic place of worship in London except the Ambassadors' Chapels. The rest range variously from about 100 to 21. The utmost therefore that can fairly be gathered from these Dissenting statistics is that the City clergy might with advantage exert themselves more actively than they sometimes do. Besides, if the City Temple is to be pressed into the argument on one side, Churchmen have a right to demand that the genuine original Temple Church, also just within the City line, and crowded as it deserves to be for its services and its sermons, should not be overlooked.

On the Church statistics we do not propose to dwell in detail here, first because those familiar with the subject will find nothing very new in them, secondly because we have no guarantee for their accuracy, and chiefly because it is not on these points that our contention against the destruction of the City churches mainly hinges. But one or two passing observations will not be out of place. The accommodation in St. Paul's Cathedral is stated at 3,600, whereas the Cathedral will hold, and not unfrequently does actually contain, some thousands more. Taking again three churches of which we happen to know something, St. Augustine's, St. Bartholomew's, Moor Lane, and St. Ethelburga's, Bishopsgate, we note that the congregations in all three are rated at considerably under 100. There certainly often are, or used to be, much larger congregations in two, if not all three of them. And this leads us to notice the transparent fallacy of taking attendance at the Morning Service, at 11 o'clock presumably, as an exclusive test. It is notoriously a prevalent, however objectionable, habit among the classes who mostly frequent City churches for the men to lie in bed on Sunday mornings while their wives cook the dinner, and hence the evening services are much more largely attended than the morning. Roman Catholic churches again, like St. Mary Moorfields, have several early masses on Sundays, besides the High Mass at 11, and a similar custom prevails in several of the Anglican churches, including St. Paul's Cathedral. The 11 o'clock service therefore is an inadequate test, except at Dissenting chapels, even of the morning congregations. But the main objection to the reckless scheme of Sacrilegious Vandalism, which these cunningly concocted tables of sensational statistics are intended to promote, and which even Mr. Carlyle denounced as "a sordid, nay sinful piece of barbarism," does not turn on any wrangle over the detailed accuracy of "surprising and interesting figures." We have shown good reason for regarding these statistics as in many respects misleading, but there are far graver issues at stake. Two other objections, both important though hardly the most important, are just noticed by the *St. James's Gazette*, but noticed only to be disparaged or put aside, namely that "most of these churches are fine fabrics, some of them very beautiful"—which unfortunately applies to some already destroyed—and that a turn in the tide may some day bring back the population of the City—a point dwelt on with much force in a letter of Mr. Richards's to the *St. James's Gazette* of Wednesday last, where he calls attention to the acknowledged healthiness of the situation and the "thousands of unlet flats and chambers" which might, and not improbably will hereafter be utilized for dwelling purposes. And this consideration can the less be ignored with impunity, because if the churches were destroyed, the site of church and churchyard would at once be ruthlessly swept into the market, and could never be recovered. On the æsthetic or archaeological aspects of the question there is the less need to enter here at any length, because in "a Plea for Wren's Churches" we devoted a special article to that subject two years ago. But we then also intimated that there were grave objections on religious and practical grounds to the proposed scheme of demolition, and this side of the question, which is too apt to be altogether lost sight of, will bear a little further treatment. But it may be worth while first to note that what is called the æsthetic argument is by no means one that only concerns "æsthetes"—to use the rather questionable nomenclature adopted by disciples of the modern Renaissance—nor is it exhausted by merely enumerating the several beauties of Wren's churches taken apart, though it must be remembered that in many of them are to be found old monuments, old pictures, old decorations, and last, but not least, old customs, which it would be a grievous pity to lose. The churchyards too, with the trees or garubs which are, or may be,

planted in them, offer, it has justly been observed, a rest to tired eye and brain, none the less real because those who benefit by them are often unconscious of it. But we were going to observe that in rebuilding the City after the great fire Wren studied general effect as well as the appearance of the separate churches, and designed the various steeples to harmonize with his great work at St. Paul's. To destroy them would be to mar the beauty of what is still, in spite of some modern excrescences, a singularly beautiful town.

But important as are these considerations the moral and practical objections to the reckless scheme of destruction now so widely advocated appear to us even more decisive. They are excellently treated in an article contributed last year by Mr. Kegan Paul to the *Nineteenth Century*, of which we shall not scruple to avail ourselves as occasion serves. And his plea for "the proper use of the City churches" comes with all the greater force from one who does not write, or profess to write, as "a good Churchman," and indeed almost goes out of his way to remind the London clergy to whom he appeals that he "has deliberately abandoned the faith they hold." He addresses them therefore as an outsider from what may perhaps be called an Agnostic though not certainly an unfriendly or irreligious point of view, and reminds them in substance that, as men want some kind of religion, it is the duty of "the priests of a grand historic Church," which claims the exclusive right of supplying this want to do what lies in their power to utilize their opportunities and make their ministrations effectual; and he goes on to show what excellent use might be made of the City churches for this purpose; that is of course if the incumbents resided in their parishes. For it is in truth the non-residence of the clergy rather than the want of a congregation that has led to the desertion of the churches. The population, as he justly observes, has not left the City; "on the contrary there is no spot in the world where so many human beings are crowded together for the greater part of each week," and therefore no spot where "a wise clergyman would have so great opportunities of usefulness among the young, the active, the intellectual, the sceptical, and the curious—in fact among just those classes at whom the parson hardly ever gets." For it will not be gravely maintained, at least by the ministers of a Church which provides a form of daily prayer, that religion is simply a matter for Sundays. The writer goes on to speak of short services in the middle of the day, when almost every one employed in business in the City takes a full hour's interval of rest, and bears personal witness to the success of the experiment when tried at St. Ethelburga's, Bishopsgate, where "the church was crammed at every one of the services," till the whole thing was brought to an abrupt conclusion by the result of we forget which of the Ritualist prosecutions we have heard so much about of late. Similar experiments have been tried elsewhere with equal success, and we cannot but think the writer is somewhat unjust in his strictures on "the great metropolitan Cathedral," which, in spite of "the deadly shade of canonical hours," not only "ought to lead the way" but has actually led the way in this movement. No doubt the ordinary Cathedral services are performed there as elsewhere, and they are often largely attended, but we should be surprised to find that any Cathedral in England had rivalled the recent activity of St. Paul's in developing other besides strictly "canonical" functions. Certainly the Dome is often filled at the daily or almost daily services held at midday during Lent and Advent, and probably at other seasons also. Mr. Kegan Paul suggests other ways in which the City clergy, whether of the High, Low, or Broad School, might easily find or make opportunities for grappling with the sin, misery, and ignorance, which abound in their parishes; and he adds, truly enough, that it is not only the orthodox or religiously disposed who would value these short week-day services. His old Eton experiences of the daily College chapel and more recently of St. Ethelburga's, help to prove that a rest for the spirit is often to be gained where others are praying even by those who do not pray themselves. Nor would it be difficult to introduce into City churches the custom, very common abroad, where a congregation without a priest, led by the village schoolmaster or some other lay representative, recite hymns and litanies for themselves, or to open the church for private prayer or retirement. And for such purposes "the little out of the way churches which nobody can use"—as we often hear said—are just those which would be found most serviceable. But there is no need to go further into details, which would readily suggest themselves to those concerned, according to circumstances. Enough, and more than enough, has been said to prove that there are practical as well as æsthetic and antiquarian grounds for sternly resisting the threatened destruction of these ancient shrines, and we quite agree with the writer already quoted that the one practical argument urged with wearisome iteration on the other side completely breaks down the moment it is seriously examined.

We are told once more by the *St. James's Gazette*—for perhaps the thousandth time—that a new population is growing up in the suburbs, whose religious wants can only be supplied out of their own pockets, and accordingly the City churches should be demolished, and "their ministrants and incomes employed elsewhere." We fail to appreciate the summary logic of this modest proposal. Why cannot the population of the London suburbs, who are certainly not less wealthy as a rule than growing populations elsewhere, pay for their own new churches? Moreover there is much force in Mr. Kegan Paul's contention that what is wanted there is generally not so much the multiplication of churches as of services. In the City nobody has time to stir more than a few paces from his place of business; in the suburbs most people have plenty of time to walk a little way to church, and many would

prefer it, so that one central church with a staff of ten clergy and frequent services might do all or more than all the work of ten scattered churches with one or two clergy apiece. But in any case the "simple plan" of robbing Peter to pay Paul has neither honesty nor policy to recommend it. It will be quite time enough to talk of transferring ministrants and incomes to the suburbs when the City clergy have at least fairly tried the experiment of utilizing their churches, which too often stand empty where they are, not from any want of worshippers, but because the pastor has left his many sheep in this peopled wilderness and gone off to enjoy the dignified repose of a suburban home. We spoke in a former article of one distinct use of such churches, as "the religious centres of Guilds, Confraternities, and the like." It has now been shown that they may also subserve other and still more obvious needs. To argue from an ingenious calculation of the number present at certain City churches on a particular Sunday morning in May that the sooner churches and incumbents are improved off the face of the earth the better is about as reasonable, not to say religious, as to argue that a man need not say his prayers because he has no Sunday coat.

THE CURIOSITIES OF CRITICISM.

WHAT critics have said about authors, and what authors have said about critics, is a topic that might be treated of with more learning than Mr. Jennings has displayed in a little work on the *Curiosities of Criticism* (Ohatto & Windus). He has written chiefly about modern and English critics. He has not gone back to the fine old quarrels in which Callimachus, Theocritus, and Apollonius Rhodius were mixed up. At the Court of the Ptolemies, poets and their rivals behaved much as they did at the Court of Louis XIV. They made fun of each other's legs, and verses, and compared each other to the scavenger bird of Egypt. Envy was then believed by Callimachus, as by Balzac, and by authors at large, to be the motive power of criticism. The quarrel in Greece was so old as to have become proverbial, and when Plato quotes the lines about "poets hating poets, and potters potters," he was doubtless thinking of feuds between the poets who succeeded and were popular and the poets who failed and said disagreeable things. The philosophers were no better. Several Platonic dialogues are really criticisms of the popular Sophists, by the Sophist whose unpopularity ultimately took the strong shape of a dose of hemlock. There are few better examples of the "candid friend" style of criticism than the passages in which Aristotle reviews the Platonic theory of ideas. Later criticism at Alexandria produced the exuberant spitefulness of Zoilus and the meddlesome activity of Zenodotus. Aristarchus became the patron of all sound criticism, and commentators preferred being wrong with him to being right with Aristophanes. French society, from the age of Boileau to that of Paul de St.-Victor, would have provided Mr. Jennings with abundance of anecdotes. Molière and his critics alone would supply material for a very curious and amusing chapter; and the quarrels of classicists and romanticists, of Balzac and Sainte-Beuve, of the critics who write and run away, and of the critics who cross swords, might have been made no less entertaining. The mere name of Pope suggests a whole literature, at which Mr. Jennings has glanced, of spiteful criticism. But he has preferred to deal, as a rule, with the feuds of our own century—with Keats and the *Quarterly*, Mr. Tennyson and the same censor, Mr. Gilbert and the *Pall Mall Gazette*.

In any active literary age it must needs be that offences come. In such ages criticism is a profession. Now all professions, from acting to medicine, have their jealousies; but it is not the business of other professions to be perpetually talking. This is the business of criticism, and so the troubled waters are constantly being stirred over again, and the mud is brought up to the top. Criticism is an art practised on the most sensitive of all human beings—poets, and men of letters. No other class is so ready or so able to cry out when it is hurt, and Mr. Jennings has made an amusing selection of the cries of injured vanity. Swift called "the true critic" "a dog at the feast." Ignorance, he said, is the father of criticism; noise, impudence, pedantry, ill-manners, are her offspring. Mr. Ruskin, that gentle critic who has scalped Guido, Salvator Rosa, Claude, and Mr. Whistler, is, in his milder moods, of the opinion that criticism is a piece of bad breeding. Goldsmith thought that "by one false pleasantry the future peace of a worthy man's life is disturbed." And this is the incessant charge against critics, that they poison the existence of authors, good and bad. The accusation seems to have very little sense in it. Authors are really engaged, voluntarily, in a kind of game. They throw down the challenge to the critic, they are miserable if he does not take it up, and they become half wild with rage if his verdict is not favourable. Experience, by this time, might teach even authors that critics have little power to make or mar.

Let a book be good or bad, if it has the element of popularity in it it will succeed, in spite of the righteous or unrighteous wrath of reviewers. And, if a book has not the salt of popularity in it, no amount of favourable or even of gushing notices will rescue it from neglect. Every great poet of the century—except, perhaps, Scott—was violently attacked in his beginnings. It was partly pedantry, partly dullness, partly political spite, that caused the *Edinburgh Review* to speak of *Christabel* as "a miserable piece of

concocting and shuffling"; while the thin and precious volume that contains *Kubla Khan* was "one of the most notable pieces of impertinence of which the press has lately been guilty. . . . With one exception, there is literally not one couplet in the publication before us which would be reckoned poetry, or even sense, were it found in the corner of a newspaper or upon the window of an inn." This blatant nonsense no more harmed Coleridge than Jeffrey's "This will never do" harmed Wordsworth. Though the world is weary of the story of Keats and the *Quarterly*, we are obliged to agree with Mr. Jennings that the Reviewer did harm the poet. The publishers of *Hyperion* (Taylor and Hessey, 1820) say "the poem was intended to be of equal length with *Endymion*, but the reception given to that work discouraged the author from proceeding," and thus a narrow and prejudiced criticism caused a heavy loss to literature. And yet even now a fair judge will admit that the *Quarterly* Reviewer did hit a number of terrible blots in *Endymion*. It would have been a misfortune if Keats's first work had been eagerly applauded, and if all contemporary versifiers had followed the worst examples of his bad early manner. There was a good deal of truth in the remark, "he wanders from one subject to another, from the associations, not of ideas, but of sounds, and the work is composed of hemistichs which, it is quite evident, have forced themselves upon the author by the mere force of the catchwords on which they turn." (Chapman had set the example of the same false method in his translation of the *Odyssey*.)

But, if Keats's energy was relaxed by the abuse of critics, we scarcely can remember another example in which malicious or just criticism stood in the way of a good book, or prevented a bad one from attracting its congenial audience. Of the latter process a rare example is Macaulay's crushing exposure of Robert Montgomery. Of the former we see a kind of trace when Shelley complains, after an assault by the *Quarterly*, "my faculties are shaken to atoms and torpid; I can write nothing." The real mischief which even sound criticism does is to check spontaneity. A writer may be warned of a fault and may accept the warning, but his natural power is abated for the moment; he thinks of his paces, and, if we may say so, is thrown out of his stride. But this sort of effect soon passes away, and the results of criticism may, in the long run, prove salutary. That righteous judgment does not interfere with a bad book's vogue we see every day in the illustrious example of certain novelists. To take an example of the other sort, a powerful critic long ago informed the author of *A Daughter of Heth* that, whatever he might succeed in, one field was closed against him—the field of fiction. But this prophecy has been eminently unfulfilled. Again, it often happens that a new book, novel or poem, is very much to the taste of the critics. The press is unanimous in its praise. The author's heart rejoices; he looks forward to many editions, and thinks that even on the system of "half-profits" there must be money for him. But the public has not agreed with the reviewers, and the publishers' books show a sale of some fifty copies, and an alarming deficit. Authors should reflect on these verities, and so learn to bear criticism without screaming aloud or writhing in silent anguish. And yet, though no one knows better than the critic the truths which we have advanced, it is probable that critics, next to really great poets, themselves suffer most keenly from unfavourable reviews. These are the amiable inconsistencies of human nature.

The ingratitude of poets has often left us mourning. Mr. Tennyson has altered or suppressed almost all the passages in his volume of 1833 which the critics pointed out to his notice. The "wealthy miller's mealy face" is no longer affectionately compared to "the moon in an ivy-tod," whatever an "ivy-tod" may be. His chestnut buds are no longer "gummy." "Then leaped a trout" has taken the place of "a water-rat from off the bank." The famous passage about

One drew a sharp knife through my tender throat
Slowly,—and nothing more,

which provoked the flippant inquiry, "What more would she like?" has been modified. An ecstatic address to "Darling room, my heart's delight," is omitted altogether, and, in short, Mr. Tennyson has usually accepted the advice even of unfriendly critics. Yet he has never shown any fervent gratitude, and even wrote fifty years ago an angry little poem on "Fusty Christopher."

We, in our humble way, are suffering from a want of kindly recognition. Two years ago we reviewed Mr. John Payne's privately printed translation of Villon's poems. While we found much to admire, we had to say that the version of the famous "Ballad of Old Time Ladies" was perhaps the worst ballade ever written. We did not like the expression "the middle modern air" from which Thais is supposed to hide. It did not seem a natural expression in Villon's mouth. "Heloïse the staid" seemed not to be well fitted with an epithet. We disliked "the queen whose orders were" to the effect that Buridan should be drowned. And we complained that "But what has become of last year's snow?" was a poor rendering of *Mais où sont les neiges d'autan?* Mr. Payne has just republished his Villon, in a form suited to a "squaresman's" modern taste, which dislikes the free filth of the Parisian burglar, when rendered, in cold blood, into English. The new volume deserves, and, we hope, will obtain, popularity. But while Mr. Payne has altered all but one of the peculiarities which offended us in his ballade, he does not seem the

more grateful. He accuses us of probably being familiar with only one text of Villon (M. Lacroix's, 1877), and of not having taken the trouble to make ourselves "adequately acquainted with the subject under review." This unkindness is just what critics must expect. But still Mr. Payne has tried to act on our ignorant advice. For "Hides from the middle modern air" he now reads "cousins german in beauty rare," which is much more accurate. For "where is Heloïse the staid?" he writes, "where did the learn'd Heloïse vade?" Vade is a charming word, though Webster says "it is obsolete or not used." Mr. Payne might have written "wade" or "fade," but "vade" is certainly more old fashioned. As for "the queen whose orders were," she has become "the queen who willed whilens." And, instead of making "where" rhyme to "were," "wear," "where" (repeated), Mr. Payne now calls our Lady, "virgin debonair." Thus criticism has had some effect on him (which is in itself a curiosity), but has not begotten a spirit of friendly gratitude. The critic must be satisfied, then, with doing good, careless of its recognition.

THE METROPOLITAN POLICE FORCE.

THAT the English are at heart a law-abiding people is shown by the ease with which the police succeed in preserving order and in keeping in check the lawless elements of the population without any military support or parade. Of course isolated instances do occur of ruffians to whom the dark blue coat acts as the traditional red rag is supposed to do upon a short-tempered bull, and who regard the wearer as something to be kicked and otherwise ill-used whenever a favourable opportunity offers. As a rule, however, the rough succumbs at once to the representative of the law; the thief, when told that he is "wanted," comes quietly away with the officer, while his comrades look pensively on and wonder when their own turn will come; the street desperadoes, disturbed in the middle of a fight, put on their coats, and either "move on" or "come along" as the constable bids them; and even the drunken virago is content with throwing herself upon the ground and requesting to be informed what the officer means by "strikin' of a woman" and sarcastically asking "if he calls hisself a man." Nor are the criminal and disorderly classes alone amenable to police discipline; the mere presence of half a dozen constables is, as a rule, sufficient to overawe the most rampant political mob. The great Chartist agitation collapsed on the occasion of its culminating demonstration; for, although "the people flocked in their thousands" to Trafalgar Square with the avowed intention of carrying out the programme of "down with leverythink," they were completely checkmated when they saw their leaders and standard-bearers hand over the seditious emblems without a murmur at the bidding of a few resolute policemen. The rioting in Hyde Park, when the railings were thrown down, was not so much a case of resistance to the police as of mischievous resentment on the part of the mob at being prevented from using the Park for the purpose of a meeting, just as an unruly troop of schoolboys might resent being kept out of their playground. The reason for this respect for authority is, no doubt, to be found in the freedom of our institutions and the security which they give to life and property. The English police cannot, even to the most distorted imagination, represent any form of Government tyranny or oppression; while the criminal instinctively feels that he has no sympathy or support to hope for from honest or peaceful folk. Exceptional cases will arise from time to time in which popular feeling is excited, and the presence of the force ceases to exercise its accustomed moral effect; but they are seldom, if ever, of a character to cause any real apprehension. Such a case has just occurred in Southwark. It appears that an unfortunate boy was drowned on Saturday last while bathing in the Thames off Blackfriars; and, his body not having been recovered by the following Monday, a youth named Ellis undertook to search for it, and, divesting himself of his clothing, was swimming out for the purpose. As it was at an hour when bathing is prohibited, and a large mixed crowd was present, the police very naturally interfered in the cause of order and decency, whereupon the young man became violent. The mob did not reflect that the Thames police, with their drags, would be much more likely to recover the body than the somewhat officious swimmer; and, having apparently a notion that they were being defrauded of a gratuitous exhibition, "went for" the intervening constables and severely ill-treated them. The police behaved, as they generally do on such occasions, with great forbearance and resolution, and, after some difficulty, carried off their captive to the station-house. The affair was an unfortunate one, but we must confess our inability to see in it, as suggested by a contemporary, any signs of a decreasing respect for authority, or any necessity whatever for considering the question whether the police shall not be either increased in numerical strength or supported by military aid. There are, no doubt, exigencies which demand a slight modification of the present arrangements for the protection of individual constables. It is not perhaps desirable to arm the guardians of the peace with revolvers, but when burglars take to them, and shoot promiscuously at housemaids, postmen, and policemen, there is, after all, a certain *raison d'être* for revolver drill. Nor are there any signs in this incident that Celtic idiosyncrasies are being reflected in the mind of the London mob. The officers who were beaten,

buffeted, and stoned were not assisting a County Court bailiff to serve a summons on a wharfinger for refusing to pay rent; they were merely endeavouring to impress upon a too ardent young man the fact that absence of costume is inappropriate in public, and that officious philanthropy is no excuse for indecency.

A much more important and necessary reform in the Metropolitan Police Force has been already foreshadowed by the Home Secretary. Its administration has long left much to be desired, and the public would no doubt be glad if more efficiency could be obtained at less expense. The apprehension of a professional thief at his well-known haunts, the removal to the lock-up of a drunkard, or the dispersal of a disorderly crowd—although very necessary functions—are not the final cause of the existence of the police. Not long ago the detective department was found to be in a highly unsatisfactory state; some dishonest officers were sentenced to mild terms of imprisonment, and shown to be such sharp and unprincipled persons that their very punishment proved an excellent advertisement for them in the line which they subsequently took up of keeping "private enquiry offices." But a Director of Criminal Investigations was appointed, the whole department was reorganized, and we were led to believe that it would in future rival the Rue de Jérusalem in intelligence and efficiency, while preserving all the old-fashioned frank and constitutional English methods. Unfortunately these expectations have not been realized, and, whatever the gain in honesty may be, there does not seem to be much in the way of additional public security; great crimes are undiscovered, and persons who are "wanted" remain so still. The report of the Committee appointed by the late Home Secretary some two years ago to inquire into these and other abuses has not been as yet made public, but we are promised that some at least of its more important recommendations shall shortly have effect given to them. These will apparently include a thorough reorganization of the administration, which is certainly much needed. The staff at present consists of a Commissioner, two Assistant Commissioners, a Legal Adviser, the Director of Criminal Investigations, and four District Superintendents. Captain Harris, who was one of the Assistant Commissioners originally appointed in 1856, retires upon a pension, and is to be succeeded by Lieutenant-Colonel Pearson, who is now one of the District Superintendents. Another of the occupants of the last-mentioned posts has lately died, so that their number will be thus reduced to two; and as the Home Secretary does not propose to fill up the two vacancies, a saving of nearly 2,000*l.* per annum will be effected. The office of Director of Criminal Investigations is also one which might with advantage be dispensed with. If the detective department were organized upon as thorough and elaborate a plan as most of the Continental secret police systems, which we by no means either recommend or desire, there would be some reason for appointing such an officer, provided he were specially qualified by training and talents for his post. But to create a separate department, and place at its head a gentleman who, however estimable and talented, has not one of the special qualifications of a superior detective officer, seems a rather clumsy and expensive way of reforming an inefficient staff. It ought surely to be possible to select from the members of the force honest and intelligent men capable of conducting the more delicate and necessarily secret criminal investigations, and to place them under the control of one of the Assistant Commissioners who already exist, and whose duties cannot be so heavy as to make this a too severe tax upon their time.

But an unnecessarily large administrative staff is not the only fault of the Metropolitan Police service; its whole financial system requires a thorough overhauling. Since the death of Sir Richard Mayne the expenses have increased by more than seventy per cent., while the numerical increase of the force is scarcely a third of this. Either this extravagant expenditure should be reduced, or more efficiency should be had for the money; many people, indeed, believe, and not unreasonably, that both these ends might be simultaneously obtained. The general efficiency of the Metropolitan Police Force and the reasonable cost of its maintenance are questions of which the public is well capable of judging, and the effect of the changes which Sir William Harcourt announces will be carefully watched and criticised. If they are found insufficient, public opinion will demand further and more stringent measures of reform. The question, however, of the constitution of the detective department and of its workings must necessarily be left more to the discretion of the higher officials, only the ratepayers have a right to insist that the work shall be thoroughly well done. We have not, we are thankful to say, an elaborate system of *espionage*; honest and peaceable citizens have not their goings out and their comings in recorded in *dossiers* to be used against them in the event of their becoming criminal or political offenders; but for all that it should not be possible for a thief to get clear away with some thousands of pounds worth of jewelry, or for a murderer to commit a ghastly crime and leave no clue to his whereabouts or identity. Yet these things are happening every day and with even more frequency since we have had an officer whose sole business it is to see that they do not occur. A little more care in selecting and training the men required for more delicate and special services would, we fancy, achieve the desired object.

THE BANK OF FRANCE.

WE do not usually devote much space to the analysis or reports of financial institutions; but, for reasons which we hope to make clear as we proceed, we think it worth while to make an exception to our general rule in the case of the Bank of France, and to examine in some detail its Report for the year 1880. The transactions of the Bank last year exceeded the enormous sum of 400 millions sterling. In other words, the turnover of the Bank was about twice the amount of the indemnity exacted by Germany from France at the close of the late war. These figures will give some idea of the magnitude of the business done by this great institution, and consequently of the important part played by it in the economic life of the country. As further evidence of its financial importance, we may notice that at the end of last year the coin and bullion held by the Bank exceeded 70 millions sterling. The increase in the business last year was over 17 per cent., and the whole of this increase was in the discounts and advances. It was partly due to new activity displayed by the Bank itself in getting business. Previously the Bank had fallen into a course of routine, and its more enterprising competitors were beginning to take away the market from it; but last year it gave greater facilities to its customers, and consequently attracted a larger amount of business. The principal cause of the increase in its transactions, however, was the growth of speculation in France. In the summer of 1879 a great speculative mania set in, which has gone on increasing ever since; and, in consequence of this speculative activity, the business done by all the banks, and of course by the greatest of them—the Bank of France—has been greatly augmented. The bulk of the business consists of the discounting of bills. Last year, for example, the bills actually discounted amounted in value to the enormous sum of 348 millions sterling. It is to be borne in mind that, unlike the Bank of England, the Bank of France has branches in all the departments, and that consequently it is a country as well as a metropolitan bank. Indeed, the business done at the branches somewhat exceeds the business done at the head office in Paris. It is curious to find that at the branches the average amount of the bills discounted seems to be slightly greater than those in Paris. But, whether at the branches or in Paris, the Bank, vast as is the business done, chiefly accommodates small traders. It would seem to be much more than its competitors the bank of the retail trade proper. For example, the total amount of the bills discounted in Paris last year was a little over 164 millions sterling, and in number they were 4,436,168. The average amount of each bill, therefore, was 924 francs, or a little under 37*l.* At the branches the total number of bills was 4,749,409, representing a sum of nearly 184 millions sterling. Consequently the average amount of each bill at the branches was 968 francs, or about 38*l.* 13*s.* 6*d.* The average amount for which each bill was drawn was thus slightly higher at the branches than in Paris, yet in both it was very low. We may further state, as showing to how humble a class this great institution affords accommodation, that at Paris there were as many as 11,289 bills of the value of 10 francs, or 8*s.*, and under; while nearly a quarter in number of all the bills discounted in Paris were of the value of 4*l.* and under. The fact illustrates the different character of trade in France and England, while bringing out the peculiar nature of the business done by the Bank of France.

The Bank, as we know, holds the ultimate reserve for the whole of France, and therefore it is of great interest to trace the movements in the coin and bullion held by it. During the year there was a loss of very nearly 8 millions sterling in the metallic reserve of the Bank, while in the gold proper the loss exceeded 7½ millions sterling. This was the loss at Paris and the branches taken together. But at Paris itself the loss amounted to as much as 9,348,000*l.*, and the loss has been going on for several years. In fact, the gold at the end of last year was in the proportion to the silver of only about 1 to 2½. And during the current year the drain of gold has continued. Even at the end of December last the gold at the head office in Paris had fallen below 8 millions sterling. As we have seen, the loss is exclusively at the head office. The reason of this is easily understood. The Government, not wishing to alarm trade or to ruin speculators, has discouraged the Bank from raising the rate of discount, as it should have done long ago, in order to stop the drain of gold. But, as it at last became alarmed itself at the magnitude of the drain, it undertook to order the Receivers-General throughout the country to pay into the branches of the Bank all the gold collected by them. Thus, while gold is being drained away from Paris and a few of the great cities, such as Marseilles and Havre, it is being paid in at the branches by the Receivers-General. In other words, the gold circulating in the hands of the public is gradually being gathered up by the officers of the Government, and paid into the bank; part of it remains there, but a large part also is drained away. If this continues, the result must be that the gold will disappear altogether from the circulation in France, and silver and notes will take its place. The directors of the Bank in their report for last year say, and say truly enough, that the drain of gold is chiefly caused by the succession of bad harvests with which France has been visited. France, which only a few years ago always grew enough of corn for its own consumption, and grew a large surplus of wine which it sold to other countries, as well as a large surplus of sugar, has during the past few years been obliged to import immense quantities of corn from the United States and wine from Spain and

Italy. And as, owing to the protective tariffs of these three countries, and the comparative poverty of the two latter, they did not buy from France as much as she bought from them, France has had to pay for her purchases in gold. But this is not the whole explanation of the matter. The extraordinary speculation to which we have referred above, and which has led France to purchase all sorts of Stock Exchange securities abroad, has given foreign countries a command over her markets, which they have used to drain away her gold. England has drawn upon the gold reserve of France to pay for the food imported from the United States, while the United States have drawn to pay themselves. If now a series of good agricultural years should succeed the bad years with which France has been visited, the drain would probably not only be stopped, but even reversed. France would then be able to recover part of the gold she has lost. But until the phylloxera is somehow overcome, France will have to import wine from Spain and Italy, and will have to pay for it with gold. As long, too, as the speculation that now prevails continues, she will have to pay for her purchases of securities by the export of gold.

Partly to displace gold, for the purpose of gathering the metal in, and partly in answer to the demand for increased circulation caused by the speculative activity, there was an increase in the note circulation of the Bank during the year, though not a very large one. At the close it amounted to a little over 90 millions sterling; the total number of notes somewhat exceeding 10,800,000. Of these as many as 189,000 were for 5 francs, or 4s., and under; while 283,000 were for 20 francs, or 16s., and 25,587 were for 25 francs, or 17. Thus in all, nearly 500,000 notes were circulating at the end of last year of the value of 11. and under, out of a total number, as we have said, of 10,800,000. The great bulk of the notes, however, were for 100 francs, or 4l., numbering, in fact, 7,555,345. During the present year, we believe, the circulation of small notes has increased very much. The Bank must depend almost entirely upon the issue of the small notes to replenish its gold reserve. It is only these small notes that can take the place of coin. Silver the public evidently will not receive in any large amount. They pay it in again as fast as they receive it. But small notes are handier even than gold, and are preferred by the people. The Bank, on resuming specie payments after the war, withdrew nearly the whole of its small notes, on the plea that the tax imposed by the Government made the small-note circulation unprofitable. The necessity of replenishing the gold reserve has, however, overruled this objection, and the small note circulation is now increasing. How far it will succeed in replenishing the gold reserve remains to be seen. While the depreciation of silver lasts, there is an evident profit in exporting gold from France and retaining silver. Silver is quite as effective at home to discharge obligations; but in many foreign countries it will not discharge a debt. Gold, therefore, will be exported until France ceases to owe money to other countries.

SCULPTURE IN 1881.

THE average of merit in sculpture at the Royal Academy this year is not quite so high as it was in 1880; but there are more decidedly interesting works, and the general arrangement is such as to bring into unusual prominence those few statues that are worthy of prolonged attention. It is well known that the same influences that watch over the hanging of pictures do not decide the placing of sculpture; but it really seems an amusing paradox that the same year should see the one work performed so unusually ill and the other more satisfactorily than ever before. The long series of busts, hitherto exposed upon a high straight shelf running round the Sculpture Gallery, are this year exhibited each on its own pedestal. All that is now required is that the bases should be drawn a little further into the room, so that the busts can be inspected from behind. In the Central Hall the centre-piece of flowers and shrubs has been done away with, and the extra space employed for the isolation of Mr. Lawson's "Cleopatra" and Mr. Brock's equestrian group. In the Lecture Room an honourable site has been secured for Mr. Calder Marshall's "Sabrina" and Mr. Thornycroft's "Teucer." There is still room for much improvement in the Vestibule, a gallery always given up to works in relief, which are positively distorted by the perpendicular fall of the light. But we chronicle with much pleasure the proof of an intelligent desire to do as much for sculpture as perhaps can be done without an entire remodelling of Sydney Smirke's unfortunate suite of galleries.

Mr. Hamo Thornycroft has celebrated his election to the titular honours of the Academy by exhibiting in his "Teucer" (1495) a statue which surpasses all that he has previously produced. He takes as his motto six unusually vigorous lines from Pope's *Iliad*, in which the Homeric bowman pours out his splanetic rage at being unable, in spite of all his skill and cunning, to hit the body of Hector. Mr. Thornycroft expresses this savage malice in the head of his figure; with his large eyes, bent forehead, and sharp lips, the brother of Ajax seems to "live along the line" that his arrow has described; he scarcely breathes for excitement, hoping against hope. The legs are still rigid, the bow hardly sinks, the tension of the arms is only slightly relaxed. The modelling of this naked figure is singularly learned and courageous, erring, if it errs at all, in a slightly archaic treatment of the muscular forms. It is not quite easy to find a point of view in

the Royal Academy from which the head, which is particularly full of dramatic vigour, can be agreeably seen; and the back of the statue is in shadow. Enough, however, is visible to enable us to recognise in this figure, not merely the most important work of the year in sculpture, but such a work as is rarely executed by an English artist. Mr. Lawson's "Cleopatra" (1478), without being nearly so original or so finely modelled, is nevertheless a very interesting statue. The dying queen sinks back in her throne; the asp lies on her uncovered bosom; one foot is drawn sideways, the other is thrust forward; the right arm hangs helplessly over the rim of the throne. The forms of the figure are massive, and Cleopatra is represented as in middle life. In the action there is a good deal of dignity, and the conception of the statue is well thought out; but the work has been hurried, and is carelessly finished; the modelling of the arms and feet is particularly faulty. Of Mr. Calder Marshall's five ambitious works, the large bronze group of "Sabrina thrown into the Severn" (1496) is decidedly the best. We find little merit in the weak and etiolated figure in marble called "The Prodigal Son" (1498), which has been bought under the Chantrey Bequest. The "Noonday Idleness" (1445) of the same sculptor, a bas-relief of two girls, is very graceful. Among the other imaginative works in the room must be mentioned Mr. H. E. Leifchild's "Opportunity" (1482), a spirited male figure, with wild flying drapery, and with the traditional forelock well developed; and Mr. A. G. Atkinson's "The Angel binding Satan" (1537), a group which shows some vigour of composition, but which is badly balanced, and treated too conventionally to be interesting. Great praise is due to Mr. T. Stirling Lee for the progress which he shows this year in his very fine statue of "Cain" (1510), one of the most learned pieces of sculpture in the exhibition; Mr. Lee seems to have thrown off his extravagant fondness for Carpeaux without losing the effects of thorough French training. "Shielding the Helpless" (1484), by Mr. E. B. Stephens, represents a warrior, with shaggy hair and a heavy moustache, protecting a child which clings to him. There is grace in the modelling of the young figure, but the man reminds the spectator at once, and so closely as to seem a mere imitation, of Foley's celebrated statue of "Caractacus." Mr. Brock sends his fine equestrian group called "A Moment of Peril" (1486), in bronze, and it has been bought under the Chantrey Bequest. We described this group of a Red Indian spearing a python at length when it was exhibited last year in plaster. Mme. Desnard cannot be congratulated on her pretentious bronze of "Judith with the head of Holofernes" (1490); the action is ludicrously false. Mr. Henry Holiday's draped recumbent figure named "Sleep" (1539) is pretty, but weak and rather frivolous. Miss Canton deserves praise for her carefully-wrought bronze statuette of a "Maenad" (1553), tipsily loughing head downwards.

The present exhibition is remarkable for the number of works in low relief which it presents. Mr. Armstead's "The Ever-reigning Queen" (1448) has so much beauty, not only of imagination, but of workmanship, that we doubly deplore one accident, which is as a dead fly in the sweet ointment. Nothing could be more beautifully modelled than the body of the goddess, than the wanton amorette, than the lazily plunging dolphins, or the calm perspective of the sea. But all this is lost to the casual spectator through the startling ugliness and coarseness of the face. As a presentment of Aphrodite this might have satisfied an artist of the most archaic age in Greece, but it is hardly admissible in the work of a modern sculptor. We believe that Mr. Armstead has obtained this unfortunate result by persisting in disregarding the rule to which we have drawn attention in these columns before, that in very low relief the face must always be treated in profile or fully in front; the features of the goddess are drawn here midway between the two, and the result is positively ugly. "The Obedience of Joshua" (1469), by the same accomplished artist, is even more Ninevite in character than "The Courage of David" last year. Here, also, the sculptor has attempted certain experiments which have been but partially successful, and here again, outside these experiments, the workmanship is beyond praise. Mr. Thornycroft's "Our sweetest songs are those that tell of saddest thought" (1462) is an alto-relievo of a girl's head; the mouth is open as though singing and sobbing; this is a decorative work, lightly but poetically touched. Mr. George Tinworth sends a terra-cotta panel to the Royal Academy every year, and it is always placed, as by a tradition, in the same corner. We do not think that the "Triumphant Entry into Jerusalem" (1444), though of course full of cleverness, is quite up to Mr. Tinworth's average; it is over-crowded with figures, tier behind tier, and the faces present a needless brutality. Mr. Adams Aetons's "Angel of Patience" seated by a sick man's bed (1532) is an alto-relievo curiously treated, but not without a certain poetic charm. It would undoubtedly be effective in a church.

In iconic sculpture there is much this year that is good, not very much that can be praised without reservation. The two best busts are Mr. Boehm's "Mr. Gladstone," in marble (1497), more delicately finished than any work by this fluent sculptor with which we are acquainted, and Mr. Percival Ball's "Miss Mabel Gell" (1475), an exquisitely modelled head in terra-cotta. Hardly inferior to these, and of a very high order of merit, is Signor Amendola's "Miss L. Lehmann" (1447), the best work of this promising sculptor which we have seen. Mr. Roscoe Mullins also shows considerable advance in two excellent marble busts (1450 and 1471). Mr. Brock, on the other hand, scarcely supports his reputation with his marble head of "Mr. Guest" (1459), and dis-

tingly disappoints us with his bronze bust of Sir Frederick Leighton (1559). His "Marchioness of Westminster" (1493) is better than either of these. Mr. Hamo Thornycroft's marble bust of Professor Owen (1487) is a striking and effective study, not carried very far. Mr. Pinker has succeeded fairly well with his bust of the late Duke of Portland (1467). Miss Henrietta Montalba has scarcely reached her ordinary high level of excellence in her terra-cotta of Miss Du Maurier (1473). Another lady-sculptor, Miss Georgianna Bulley, has modelled a very clever head of a Hindoo, and has called it "One of Her Majesty's Subjects" (1528). Her "Contadina" (1530) is hardly so successful, perhaps because it is more ambitious. Among busts which deserve commendation we must not omit to mention Mr. Birch's "Miss A. M. Bruce" (1466), Mr. Boehm's "Carlyle" (1481), Mr. Onslow Ford's "Dr. Forrest" (1529), and Mr. Hubert's "Dr. T. Gordon Hake" (1540). Nor must we neglect to point out, as specimens of all that a bust should not be, Mr. Bell's grinning head in terra-cotta (1549), and the smooth, characterless portrait (1560) by Mr. G. Simonds. This latter is a miracle of fatuous effort.

One or two miscellaneous works at the Royal Academy still call for notice. Mr. Birch's colossal figure of the Maharajah of Bulrampore (1500) is a stately and solid monument, which may be compared, greatly to its advantage, with Mr. Bruce Joy's singularly dull and poor statue of "Harvey" (1474). Herr Julius Haebnel exhibits a large bronze statuette of a "German Wild Boar" (1516), which is remarkably vigorous and well composed. Mr. George Simonds has caught something of the early Greek severity in his "Medusa" (1547), but, as in the bust we have just mentioned, he has spoilt the surface by tasteless elaboration. In the "Panther" (1522) Mr. Lawes has attempted one of those incidental works which test well the temper of a sculptor's mind; the verdict of the spectator is not a favourable one.

The show of sculpture at the Grosvenor Gallery is inconsiderable. Mr. Thornycroft exhibits a charming decorative panel, in basso-relievo, of a "Huntress" with her hound beside her (217), and a bust of "Professor Ella" (226). Miss Henrietta Montalba has a very refined portrait, in terra-cotta, of "Mrs. Comyns Carr" (222). Mr. Boehm is represented by a beautifully finished marble bust of "Mr. Ruskin" (250), destined for the Drawing School at Oxford, and by a statuette in terra-cotta of "Carlyle" (317), reduced from the large statue in possession of the Earl of Rosebery. Signor Amendola sends a small plaster group of two "Sisters" (316), one seated, the other standing beside her; and Mr. Roscoe Mullins a small marble group (318) of a child resting in its mother's arms. All these sculptors, it will be noticed, are also prominently represented at the Royal Academy.

THE OPERAS.

AT the first representation of *Mignon* at Her Majesty's the title rôle was played by Mme. Christine Nilsson. Of her representation of the character it is almost unnecessary to speak, as we have often before drawn attention to the delicate rendering of it which this great artist gives. As to the singing and the dramatic nuances, it is well known that Mme. Nilsson comes as near perfection as possible, and it might almost be said that, were it not for this, the opera, which at best is but poor, would not hold its own on the London operatic stage, so wholly dependent is the work upon the dramatic rendering of the chief parts. Mr. Maas sang the part of Wilhelm very well, and showed some improvement in his acting powers, which we regret to say are not of the highest; yet his pure tenor voice is always welcome, and he seems to have devoted much study of late to its development. Mlle. Lilli Lehmann was Filina, and Signor Rota appeared as Lotario. To those who have been accustomed to the Federigo of Mme. Trebelli at this house, that of Mlle. Anna de Bellocca must have been somewhat disappointing; but it is not given to every artist to raise a secondary part to a position of importance, and Mlle. de Bellocca should not be censured for failing to do so. Signor Ardit's conducting was, as we have had occasion before to notice, of a flabby and unsatisfactory kind, and the chorus was not as good as it might have been.

The first semi-novelty of this season has been performed at Covent Garden. After an interval of fifteen years *Il Seraglio* has been revived on the London operatic stage. This, one of the earliest of Mozart's comic operas, was written one hundred years ago. It was completed in July 1781, but was not performed until a year after, and came next in point of time to *Idomeno*. Curiously enough, it was mainly due to professional opposition that *Il Seraglio* was not performed soon after its completion, although Mozart had avowedly written the chief part for the favourite soprano of the day at Vienna, Mlle. Cavalieri, of whose powers the composer had the greatest admiration, and it was only, as might be said, by the will of the Emperor that it was at last submitted to the public. The real reason that this charming comic opera is a stranger on our operatic stage is that it was written for the exceptional voice which Mlle. Cavalieri possessed, and it is only when a singer with the powers of Mme. Sembrich presents herself that it is possible to produce it with success. A contemporary suggests that Mozart wrote the part of Costanza in remembrance of the fine voice of his old love Aloisia Weber, but there is documentary evidence to prove that Mlle. Cavalieri, who first sang the part, "was a singer of whom Germany might well be proud," and that the Costanza music was expressly written for her. The work, according to the traditional manner of Ger-

man comic opera of that date, is written as a dialogue opera. In the version performed on Tuesday last the recitatives have been supplied by Sir Julius Benedict, who has done his work with great judgment. The success of the work on production was at once evident, and Mozart in one of his letters wrote that the opera was performed on one occasion at the express desire of the veteran composer Gluck, who was very complimentary to him about it. Greater praise Mozart himself could not have looked for. *Il Seraglio* was written shortly before his marriage with Constance Weber, not perhaps at the happiest time of his life, for his stern father was averse to his marriage, and, as we have said before, professional jealousy dogged his path; but nevertheless his freshness and genuine humour never forsook him, and the result was as charming a comic opera as has ever been drawn from his prolific pen. The plot of the opera is as slender as most of those which he has written, but it may be as well to indicate it. Two girls, Costanza and her companion Bionda, having been captured by pirates, are sold as slaves to the Pacha Selim, who falls violently in love with Costanza, and hands over Bionda to his gardener Osmin. Of course their respective lovers, Belmonte and Pedrillo, his attendant, come in search of them, and, finding them, plot their escape. This is frustrated by Osmin, who, although he has been made very drunk by Pedrillo, is apparently sober enough to turn up at the very moment he is wanted. Finally, the most nobly sentimental of Pachas confers freedom and "happiness ever after" on the two pairs of lovers. Absurd as the libretto is, it is wedded to some of the most charming music that Mozart has ever written.

It is only, as we have said before, when a singer of Mme. Sembrich's calibre presents herself that the production of this opera is possible; and she fully sustained the character for extraordinary vocalization which she has already gained on the London operatic stage. With the surprising compass of voice which she possesses, it seemed that she had no difficulty in overcoming the exceptional music which the composer has allotted to her part. Her rendering of "Che pur aspro al core," which was enthusiastically encored, was really remarkable in the annals of Italian opera. Added to this, her acting is worthy of praise, especially in the quartette in the second act. Mlle. Valleria took the part of Bionda, and showed considerable ability in her delineation of it. Her rendering of "Con vezzi e lusinghe" was tender and artistic, and her joy at the prospects of escape in the quartette in the second act was as good a piece of acting as we have lately seen on the lyric stage. M. Vergnot's Belmonte was but tame, though he sang the music of his part in a creditable manner; whilst M. Gailhard as Osmin, a part of no ordinary difficulty, deserves praise for his representation. His acting in the drunken scene with Pedrillo is one of the most comic situations of the piece, and his performance in this shows him to be an actor of considerable power. The Pedrillo of M. Soulaçroix is perhaps one of the best we have seen. Signor Scolaro was the Pacha.

Great care has evidently been given to the production of this work, with a desire to make it as pleasing to the audience at Covent Garden as was possible; but we cannot see the necessity of interpolating the "Rondo alla Turca" of Mozart's Sonata in A by way of attraction. Indeed, the action of the piece is greatly impaired by it as it stands, for, instead of the procession of the Pacha being greeted with the celebrated chorus, "Al Bascia" (the only chorus in the opera), the whole action is stopped to give place to a senseless ballet, which is danced to a not particularly well-orchestrated version of Mozart's Pianoforte Rondo, which was never intended to find its way into the opera of *Il Seraglio*. M. Dupont conducted with his usual ability.

Don Giovanni has been revived at Covent Garden, the main object of the performance being to introduce M. Bouhy to the English public in the part of Don Giovanni. His illness, however, prevented his appearance, and Signor Cotogni took his place. The interest of the evening then was in the performance of Mme. Fursch-Madier in Donna Anna, in which part she again showed that she possesses a fine, well-cultivated voice, of more than usual power, and further displayed much intelligence and dramatic musical feeling. Her acting is not so satisfactory, though she is evidently thoroughly accustomed to the stage. However, she had much to contend with in her surroundings, and might, perhaps, show more power as an actress were she playing with other artists who could give her more support. We have before expressed our opinion on the Don Giovanni of Signor Cotogni; and it seems to us that his performance of that part has, if anything, deteriorated. On this occasion he played it all through in a buffo style singularly unsuited to the character. M. Gailhard was the Leporello, and if it be admitted that this part should be played as a pure piece of buffoonery, his performance is entitled to great praise; but we are of opinion that for Leporello the Commandatore at Don Giovanni's supper-party in the same way in which a clown in a Christmas pantomime expresses his terror when caught by a policeman is dramatically wrong. Signor Marini did his best with Don Ottavio, and sang "Il mio tesoro" very fairly well. Signor Scolaro made a very good Masetto; he has a fine voice and some skill as a singer, and played the part with strict attention to tradition. Mme. Patti was the Zerlina, and made her usual impression on the audience. The stage management was as faulty as it too often is at this house, and one of the most impressive situations in the opera was made ridiculous. When Donna Anna fainted on her father's body Don Ottavio beckoned to a stalwart retainer at the back of the stage, who

solemnly advanced, and produced a small smelling-bottle, which he handed to the distressed lover; and, when the lady had recovered, the retainer again came forward and received it back again with a low bow. The old tradition at Covent Garden of the statue releasing Don Giovanni and leaving him to the mercy of a crowd of comic pantomime demons still survives. This curious piece of stage business may be the germ of the malignant malady which of late years has been devastating the first act of *Faust* when it is performed at this house.

The general performance was by no means good. It may be that Signor Bevnigani imagines that coldness and dullness are liked by the admirers of Mozart, and will be considered to be strictly classical; but be this as it may, we have seldom heard this splendid music so tamely rendered, whilst the concerted pieces showed great want of rehearsal; the trio of Minks, which otherwise was extremely well sung, being almost spoiled by the uncertainty of attack in the singers; and, further, to our taste Signor Bevnigani's tempi were often faulty. Whilst the early part of the overture and some other passages were perceptibly dragged, Don Giovanni's air, "Finche dal vino," was taken so fast that no living singer could hope to articulate the words, and the meaning of the music was completely lost. We may, in conclusion, give a few words of praise to the very graceful dancing of the minuet, danced at first by two figures only, the usual modified minuet being done afterwards by the whole corps de ballet.

Mignon has been performed again at Her Majesty's with Mme. Marie Roze in the principal part instead of Mme. Nilsson, whose time, it is announced, is fully occupied by the rehearsals for the reproduction of Boito's *Mefistophelo*. Mme. Marie Roze's performance of this character has been often praised, but it has much improved; the artist's progress, both as a vocalist and an actress, being more than sufficient to compensate for the very slight deterioration of voice which years of hard work have induced. She is wise enough to give a reading of her own of the part, which—without any straining after originality—is entirely different from those adopted by other singers, and this reading is throughout carried out with skill, judgment, and good dramatic feeling, the result being an impersonation which is charming to the general public and to those of her audience who have any knowledge of the difficulties and details of the dramatic art, astonishing as a *tour de force*. On this occasion Mlle. Emma Juch made her first appearance on any stage; we believe that she is of American or Canadian origin, and has received some part of her musical education at Vienna. It at first appeared a very hazardous experiment for an artist who had no stage experience to make her *début* in such a part as Filina, which belongs almost to the artificial comedy of the last century—a part which requires skilful technical treatment, and being entirely without opportunity for the display of deep emotion, cannot be represented even tolerably by mere untrained impulse. But Mlle. Juch triumphed over all difficulties. Though she is yet young, her florid vocalization gives evidence of great training, carefully and industriously followed up, whilst her expression in singing shows a true artistic nature. Her voice is a pure light soprano, of beautiful quality, and has the great charm of perfect freshness; indeed, she has every possible natural gift, a pleasing appearance, singular natural grace of movement, and a decided talent for acting. She represented the admiration-loving coquette perfectly and with singular refinement, and had thrown herself completely into her part, carrying it out in every detail of byplay as carefully as in the more important scenes. In the first act there were at first some signs of nervousness in her singing, but these soon wore off; the coldness, however, of the audience, who can never be led to applaud a new singer until some isolated air has been sung, seemed somewhat trying; and it was not until she had sung the air "Io son Titania" that she obtained the full success which she deserved. This was a most brilliant piece of bravura singing. And, on the whole, we think that Mlle. Juch is the most promising *débutante* that has appeared for many years. If Mlle. Juch were to take some pains to acquire a better pronunciation of the Italian language, she would remove the only blot on an admirable performance. It is to be hoped that she will not be led away by early success into a neglect of training or into overtaking a young voice.

THE THEATRES.

BY the choice of plays for the second week of their visit to London the Saxe Meiningen company have given us an opportunity—not likely to be afforded us again—of comparing the two extremes of Schiller's dramatic work. For *The Robbers* his biographers have commonly felt called on to apologize as a crude production of his boyhood, as something which was atoned for by such mature work as *William Tell*. His reputation is supposed to be based on the latter, or on such kindred work as the *Wallenstein* trilogy. Judging them, as Carlyle did, from a purely literary point of view, this estimate of their relative value is doubtless the correct one. *William Tell* has its own faults. It is much too didactic for one thing; but it is free from the rant of the *sturm und drang* period, and its characters are human beings, not vices and virtues made flesh. But, if they are to be judged as acting plays, the order of merit would seem to need to be reversed. *The Robbers* has an abundance of absurdities, and moments of terrible tedium; but it is full of striking scenes,

and it has a coherent dramatic action, which is carried steadily forward. After seeing Herr Nesper as Karl von Moor, we can learn from his very deficiencies what it was in the piece which attracted actors like Emil Devrient. We can guess what the part would be in the hands of Herr Barnay. Even with the help of this brilliant actor *William Tell* is far the more tiresome play of the two. Schiller maintained—and nobody will quarrel with him for it—that it is not the business of the dramatist to teach history; but he would seem to have considered that this applied only to the facts, and that the philosophy came within his jurisdiction. And so he aimed at giving a complete picture of Switzerland's heroic epoch, and of every class of its people. As a natural consequence, the unity of his plot is utterly lost. There are really three separate stories in the play, which either run parallel, or interfere with one another, while the hero is perpetually thrust into the background.

In estimating the acting of the first of these two pieces it is not easy to avoid being unjust to the performers. When a situation not only gives an opportunity for great acting, but also requires it to cover the faults of the dramatist, we are inclined to be unduly severe on merely respectable actors who do not come up to our conception of what might be done. Now, the interpretation of the chief parts in *The Robbers* stood in need of much kindly consideration. The best was undoubtedly Herr Kober's rendering of the incredibly villainous Franz—his terror being particularly good. It would be unjust to blame Frä. Werner for not contriving to make such a boyish conception of a female character as Amalia interesting; but she was certainly less pleasing than in any other she has yet appeared in, and was throughout too hard. Her Bertha, in *William Tell*, could only be an echo of the character of Gertrud; but it was better played, in spite of a certain monotony in the smiling expression of this actress, which scarcely ever varies, and re-appeared in her declamation of the lines of the chorus in *The Winter's Tale*. Herr Nesper played Karl von Moor so as to prove that in a melodrama, where the situation is everything, and no fine rendering of character is expected, he would be a sufficient actor; but he was somewhat below the traditions of his part. The smaller parts were played with spirit, and in one of them, that of Roller, Herr Teller contrived to produce a great impression in the forest scene of the third act, by a fine mixture of pathetic and comic acting.

Although this versatile actor gave the death agony of Gessler in *William Tell* with a realistic force not likely to be forgotten by those who saw it, and although Frä. v. Moser Sperner, who had been so lively as Maria in *Twelfth Night*, showed she could be haggard and fierce as Armgard, yet the most enduring impression made was by the acting of Herr Barnay. This actor, who had been so polished and dignified as Anthony, represented the rough Swiss huntsman with equal sympathy. He was dignified here also, but in a quite different way, with the untaught natural dignity of a peasant who is also a brave and able man. The half-suppressed growl of rage with which he answered Gessler's question as to what he intended his second arrow for almost justified the tyrant in keeping him in prison. Indeed, throughout the famous shooting scene his acting was admirable, and reached its highest point in his hurried rush through the crowd to find his child. There are few actors who can mingle in a crowd without being lost in it for a moment as he can. The beautiful quality of the actor's voice was well shown in his fine and subtle interpretation of every phase of Tell's emotion. Of the numerous other actors, we can only remember that their elocution was uniformly good, though it had the fault which had been too prominent in the performance of *Julius Caesar*. It was too mechanical in its cadence, and uniform to the verge of monotony. The only exception was Master G. Godeck's acting of Walther. The young player not only repeated the words and gestures of his part like a well-taught boy, but showed distinct traces of an intelligence of his own. It is needless to say that the grouping of the supernumeraries was excellent.

The management of the crowds, the beauty of the scenes and the dresses, are what will be remembered as the most brilliant features of the performance on Monday last of *The Winter's Tale*. In putting this piece on the stage the management of the German company have boldly accepted the position that the story passes in an ideal poetic world. The oracle of Apollo has not been considered as requiring classic surroundings, and the Sicily put before us is the Sicily of the Norman kings. We consider this decision as very happy, as affording opportunities for beautiful artistic effects. It is somewhat startling to see the answer of Apollo carried in in a most mediæval-looking chest, painted with quaint figures of saints, and announced by the trumpets of heralds in tabards. But the scene of the trial was so wonderful in itself that such details could be overlooked. And there can be no doubt that in Shakespeare's own time this dressing of a classical scene in mediæval robes would have seemed strange to nobody. It is in keeping with this bold accepting of the unreality of the world of the play that the scene-painter has put the sea-coast of Bohemia as a background to the sheep-shearing scene. In the Sicilian scenes the only traces of classic times are the ruins, and the houses show a most effective mixture of East and West. In the dresses we have a fine variety of splendid Italian costumes, not too strictly tied down to one period, picturesque furred robes of a Polish character, and traces of Oriental attire. Of the acting we can speak less favourably. Herr Görner's Clown was far better indeed than his Sir Andrew Aguecheek, and Herr Teller made a lively Autolycus, but the

other minor parts had nothing to call for notice. The fine parts of Hermione, Perdita, and Florizel were but poorly rendered. Frl. Haverland, who had failed to confer the proper poetic dignity on Stauffacher's wife in *William Tell*, did not rise to the height of Hermione, though her movements were dignified and her elocution fair. Frl. Schweighofer failed to show the Princess under her rustic disguise, and was ill supported by her Florizel, Herr Nollet. In the statue scene Frl. Haverland began to move so gently that it was impossible to detect her first movement. This was, perhaps, due to a respectable desire to avoid a mere stage surprise, but is, we think, a mistake, as diminishing the general effect of the scene.

It is inevitable that comparisons should be drawn between the acting of *Coralie* at the St. James's and the rendering of the same play by the French company at the Gaiety. There is happily no reason for making such a comparison a weapon of offence to either company in the present case, and it will therefore be the more instructive. The English company is certainly not inferior to the French in the power of its actors or the finish of its acting, and yet their performance is on the whole less satisfactory. We believe this to be largely due to the fact that the piece cannot be made to look natural in English society, and that Mrs. Kendal in particular has not the same freedom as Mlle. Teissandier in her representation of the character of Coralie. But it is equally due to the fact that our actors seem to think themselves bound to indicate every phase of emotion a little too emphatically. We doubt, for instance, whether any gentleman would allow a woman to drag herself round the room after him on her knees as Kelson Derrick does at the St. James's. We do not desire to see such characters as Coralie become common on our stage, and it is perhaps better that they should be largely idealized; but a lifelike representation of what such a woman would be must be sought for rather from Mlle. Teissandier than from Mrs. Kendal.

In the case of the *Dame aux Camélias* we have to thank Mme. Sarah Bernhardt for not giving us a realistic picture. No Marguerite Gauthier could by any possibility look or speak as she does at the Gaiety. She is there from first to last a high-bred lady, animated by a great passion. She thanks Armand Duval for the interest he showed in her during her sickness as a princess might. But, leaving likelihood and study of manners out of the question, we find the acting admirable. It is restrained and controlled by perfect good taste, without one unmeaning gesture or inflexion of the voice, till the moment comes for the great outbursts of passion, which are given with a fire and sincerity that almost burn out the absurdities of the play. The pathetic ring of her voice in uttering the words "Allons, voilà un rêve évanoui! C'est dommage" was infinitely touching. But it would be impossible within the space at our disposal to cite even a few of the passages of her acting which are like revelations of character. And it would be unjust could it be done. The performance must be judged as an artistic whole. It is unfortunate that Mme. Bernhardt should be so poorly supported. M. Landrol played M. Duval firmly and delicately, and the Prudence of Mme. Duchesne was equally satisfactory; but there was little to notice in the acting of the rest of the company. M. Angelo played Armand Duval as such a part deserves to be played. We gave last year a detailed criticism of Mme. Bernhardt's admirable performance of Frou-Frou.

In view of the rivalry to which it was certain to be exposed, the production of *Frou-Frou* at the Princess's cannot be said to be wise. Mr. Wilson Barrett has the advantage of possessing an excellent adaptation, which is a happiness not always granted to those who produce copies of French plays; but in one respect the very qualities of the translation militate against the company. Mr. Comyns Carr has very properly refrained from transporting the story to England, and confined himself to the more difficult achievement of turning it into good English. But by leaving the scene of the play in France, the necessity was imposed on the actors of appearing French; but this none of them are. Mme. Modjeska indeed fulfils this necessary condition so far as not to seem English, but we do not think she goes any further than that. The Brigard of Mr. Anson may also be another exception, but it is not a very happy one. His acting gave an air of mere vulgarity to the heroine's foolish father. The fault of the whole company is, indeed, want of breeding, which is painfully prominent in Mr. Forbes Robertson's Paul de Valroas. In trying to be gay he only manages to swagger, and in his parting with Frou-Frou in her husband's drawing-room and presence, he shows a noisy emotion which destroys the whole probability of the scene. Mme. Modjeska plays with greater variety than we have yet seen her show, and in the latter scenes with real power. Her acting in the death scene was touching and, for a moment, powerful; but the earlier part was very inferior. She totally failed to suggest the youthful frivolity of Gilberte, and her gaiety is never spontaneous. As a matter of course the tragedy of her fall is almost lost.

Die Ahnfrau is one of those old-fashioned melodramas which "Monk" Lewis made so popular in his time on the English stage. The story is briefly as follows. An ancestress of the noble house of Borotin, having been stabbed to death by her jealous husband, is unable to rest in her grave until the entire race is destroyed. The old Count Borotin has had two children, a son and a daughter; the first is supposed to have been drowned while a child, and the second has grown up to be a beautiful young woman, and is introduced to the audience at the rise of the curtain. With a view

to removing the curse that rests upon the house the Count consents to his daughter marrying a young man of obscure origin who has once saved her life and with whom she has fallen in love. At this moment the proposed bridegroom himself appears, and seeks shelter at the castle from an attack of robbers. He is closely followed by the captain of a troop of the King's soldiers, who are in pursuit of the band, and have reason for believing that the robber chief is concealed in the castle itself. The old Count, after allowing them to search the castle, accompanies them in quest of the marauders. The guest, and Bertha's would-be lover, turns out to be not only the bandit chief, but the Count's son, who had been supposed drowned, but really enticed away from his home for the sake of a valuable diamond which he wore, and thus thrown into the fatal companionship. The rest of the plot tells how he slays his father without knowing of the relationship, how Bertha poisons herself, and how the unpleasant ancestress, who bears a striking likeness to Bertha, after appearing at various inopportune times throughout the piece, ultimately rises from her tomb for the last time, discloses the dead body of Bertha to her brother, and kills him with the shock, thus consummating the doom of the family. The play, which is written in verse, is couched in beautiful language; and the manner in which it is played and put upon the stage makes what would otherwise almost verge upon the ridiculous a really fine picture of the extreme romantic school. The general effect is something like that of a well-conceived rendering on canvas of *Tam o' Shanter* or the *Walpuris Night*, the careful and harmonious working out of the details atoning for the want of human interest in the original idea.

In the first place, every performer spoke the words well and expressively, completely overcoming the difficulties of the peculiar short metre in which the play is written. And also no single artist was ever led away by the temptation of the enormously long speeches which many of them had to deliver into the too common vice of "stepping out of the picture" for the sake of addressing the audience. Even in this romantic, conventional, melodramatic play the "picture plane" was always supposed to be well behind the proscenium, and every figure was kept well within it. The doomed Graf von Borotin was well played by Herr Richard, the part of Bertha, his daughter, being taken by Frl. von Moser-Sperner. This was perhaps the best performance of the whole cast. This artist, who appeared so few nights ago as a merry mischief-making *soubrette* in *Twelfth Night*, now became a true heroine of melodrama. If her pathos and tears were not quite so natural as her merriment, they were nevertheless artistically expressed; whilst the scene in which Bertha is overcome by supernatural terror when she finds herself alone in the haunted castle—a scene which, in its motives and expression, somewhat resembles the "potion scene" of *Romeo and Juliet*—Frl. von Moser-Sperner showed that she possesses very considerable tragic powers. The Jaromir of Herr Nesper was very good, though a certain stiffness of style was hardly suited to this kind of play; and his almost feminine expression of the emotions of grief, despair, and repentance would scarcely be accepted by an English audience as consistent with the character of a melodramatic robber. The other parts hardly call for much notice, with the exception of the soldier of Herr Busse, which was admirably played, and formed a good example of the usefulness of good actors taking subordinate parts. His excellent acting in the situation in which the soldier so describes his encounter with the robber that Bertha discovers that her lover and the outlaw are one and the same person was not only valuable in itself, but was of the utmost service to Frl. von Moser-Sperner in her performance of the scene. The supernatural appearance of the Ahnfrau (Frl. Stangeberg) was admirably managed entirely without mechanical or optical effects. The spectre merely walked in at one door and out at another; but by skilful use of the ordinary stage lights the effect was always impressive.

At the Haymarket *Masks and Faces* has been withdrawn, and the late Mr. Robertson's *Society* has been put on the stage. It is needless now to dwell upon the faults of a play which has been for a long time familiar to frequenters of theatres; but it may be not out of place to point out that it is a mistake to attempt to correct some of the absurdities of the piece while others are left untouched. So is it, also, a distinct artistic blunder to sweep away the clever lines which Mr. Robertson wrote for the "Cock-a-doodle-do" song and to put in their place some "topical" verses of very meagre merit. As we have said, it is now needless to dwell upon the obvious faults of Mr. Robertson's play, but it was still more needless to make a vain pretence of giving reality here and there to what is, in fact, an essentially unreal piece. It must be admitted that mistakes of this kind are to a great extent redeemed by the excellence of the acting. Mr. Arthur Cecil's Lord Ptermigant is a singularly fine and studied performance. Mr. Conway's Daryl is spirited, if somewhat conventional. Mr. Kemble's Old Chodd is humorous and unexaggerated. Mr. Brookfield throws a new light on Young Chodd, who in his hands becomes the exact type of a vulgar rich young man, who, in spite of his vulgarity and absurdity, has a certain force of character which asserts itself, especially in the last scene. Mr. Bancroft has burlesqued the make-up of Tom Stylus and seems to us to have lost very much of the *verve* which he some years ago imparted to the character. Mr. Teesdale attempts without much success to play an Irishman. Mr. Dawson's performance of the fighting-man is handicapped by his ridiculous get-up. The play is supposed to be more or less written up to date, and nowadays fighting-men do not dress

as Mr. Dawson dresses "The Lamb." Mrs. Canninge plays Lady Ptarmigan with discretion, and Miss Cavalier plays Maude Hetherington with good intentions. *Society* is followed by *Good for Nothing*, in which Mrs. Bancroft plays Nan with a perception, a spirit, and a tenderness which can hardly be too highly praised. Upon her, in fact, rests the whole burden of the piece, and she carries it off with a naïveté and a vigour that cannot be surpassed. The performances of Messrs. Cecil, Conway, and Bancroft are interesting as giving proof of a versatility which might not have been expected. Mr. Kemble gives a very funny, if not very probable, rendering of young Mr. Simpson. On Wednesday last *Othello* was played for the last time for the present with its recent exceptional cast at the Lyceum. Miss Ellen Terry, Mr. Booth, and Mr. Irving have never played better during the season. We have already given detailed criticism of their performances, and it only remains to add that Mr. Booth, in a few well-chosen words, made a most graceful reference, not only to the manner in which his performances had been received by the public, but also to the pleasure which he had in acting with Mr. Irving and in Mr. Irving's theatre.

REVIEWS.

THE CORRESPONDENCE OF TALLEYRAND.*

THE English version of M. Pallain's valuable publication is idiomatic and fluent. In some passages errors of the press have escaped correction; and the force of diplomatic phrases has not always been accurately rendered. Sir Charles Stuart, afterwards Lord Stuart de Rothsay, is designated in the English text by the odd title of the Chevalier Stuart. By a strange confusion, a letter from Jaucourt to Talleyrand of the 4th of April, 1815, is printed twice over in different versions. At p. 122 the writer says that if the King had stayed in Paris "the troops would have fired upon us." At p. 271, in a more correct translation, Jaucourt declares that "he will never believe that the troops would have fired upon us." The fault would seem to be in the editor, who has unfortunately referred to inconsistent versions of a document which he can scarcely have intended to publish twice over. Nevertheless, the book will be welcome to all readers who are interested in one of the most important transactions of modern times. Although the Correspondence has not been previously published, it was largely used by Thiers in his account of the Congress of Vienna. His references to the narrative which it contains are generally accurate and fair, although he dissented from the policy of Talleyrand, for whom he also entertained a personal dislike. The historian had the additional advantage of examining the official correspondence of the French Embassy with the Foreign Office, and the private letters which passed between Talleyrand and Count Jaucourt, who occupied his post as Foreign Minister in his absence. M. Pallain has inserted in his notes extracts from M. Jaucourt's correspondence, which rather stimulate than satisfy curiosity. Both Talleyrand and his representative at the Foreign Office appear, as might be expected, to have disapproved of the reactionary policy which was pursued under the influence of the Count of Artois and his sons, through the agency of such Ministers as the imbecile Blacas. In his letters to the King down to the time of Napoleon's return Talleyrand but occasionally hints at the errors which he perceived and deplored. In quoting the language of the Duke of Wellington on his arrival at Vienna from Paris the Ambassador discreetly reminds the King that he had, in the Duke's language, Ministers, but no Ministry. The experience of many countries has shown that an independent Cabinet is the most effectual check on absolute power. Louis XVIII. was sincere in his purpose of reigning as a constitutional sovereign; but, at least in the beginning of his reign, he insisted on making his Ministers severally responsible to himself. The extraordinary folly committed by the Emperor Alexander in placing Napoleon at Elba would in any case have insured a military restoration of the Empire; but, if the King had been guided by Talleyrand in domestic as well as foreign policy, the nation would have been on his side against the usurper. It was not till Louis was a fugitive at Ghent that Talleyrand addressed to him an elaborate remonstrance on his exclusion from power of all but the emigrants and Legitimists and on his weak subservience to the princes of his family. In the same letter he communicated the disposition of the Emperor Alexander to substitute the House of Orleans for the elder branch; and he warned the King that the interest which Europe might take in his person and cause by no means extended to his brother or his nephews. It was not surprising that on the second restoration the King took the earliest opportunity of getting rid of the most sagacious of his counsellors. The influence of the Emperor of Russia, who had become at Vienna bitterly hostile to Talleyrand, was also exerted in the same direction.

During the negotiations at Vienna the King and his Ambassador constantly agreed in their policy. Louis XVIII., satisfied with the recovery of his kingdom within its ancient boundaries, was anxious to avoid any disturbance of the peace. Amongst his new allies he was most inclined to rely upon England; and the only

change which he strongly desired was to expel Marat from Naples, both as a member of the Bonaparte family and as the upstart occupant of a throne belonging to the Bourbons. Heartily agreeing with the King on the Neapolitan question, Talleyrand was primarily anxious to re-establish the participation of France in the councils of Europe. With this object, and also on account of the principle of legitimacy which he seems to have invented for the occasion, he undertook to prevent the annexation of the kingdom of Saxony to the dominions of Prussia. Louis XVIII. took a certain interest in the cause of the King of Saxony, who was a relative of his own; but throughout the Correspondence he seldom expresses himself strongly, except when there is a question of dethroning Murat. He was pleased and flattered by the partial success of the famous diplomatist, who was, as Thiers says, the inevitable representative of France in the Congress. On his arrival at Vienna, Talleyrand found that the four Great Powers which had overthrown Napoleon still regarded themselves as allies, though their quarrel with France was ostensibly terminated by the Restoration and by the Treaty of Paris. It had been arranged that France and Spain should only be consulted after Russia, Austria, Prussia, and England had in each separate case arrived at an agreement; yet it was notorious that Russia and Prussia had a separate understanding between themselves for purposes which were on different grounds obnoxious to England and to Austria. It was for the purpose of widening the disruption and of introducing France to a share in the controversy that Talleyrand declared himself the champion of the rights of the King of Saxony. The first result of his movement was to conciliate the minor German Princes, who unanimously opposed the destruction of one of the ancient States of the Empire. England and Austria contended longer against the necessity of concerting measures with France, but Metternich and Castlereagh were at last compelled to recognize the right of France to join in the common opposition. Talleyrand's haughty assertion of the claims of his Sovereign to equality had already embarrassed the plenipotentiaries of the four Powers, who were compelled to repudiate their exclusive alliance by Talleyrand's threat of leaving Vienna if their pretensions were maintained. The conclusion of the treaty of January 3, 1815, by which England, France, and Austria agreed to a defensive alliance against Russia and Prussia, was not unnaturally regarded by Talleyrand as a triumph of diplomatic skill. He had successfully asserted the claim of France to resume her former part in European politics; and he had checked the ambitious schemes of Russia and Prussia, though he had obtained no definite advantage for his own country. Before the opening of the Congress, the Emperor Alexander and King Frederick William had agreed that the Kingdom of Poland should be reconstituted in the limits which it had possessed before the first partition, with the exception of the Austrian province of Galicia. The Emperor had persuaded himself that in gratifying his own ambition he was making reparation to the Poles. He proposed to bestow on the kingdom a Constitution of the modern type, which would, as the event afterwards proved, depend on his own pleasure for its continuance. In return for the sacrifice of Posen and of a claim to the Grand Duchy of Warsaw, Prussia was to receive Saxony as a forfeit from the King, who was then a prisoner at Berlin. His crime was that he had been the last to separate himself from Napoleon, who had counted all other German States except Austria as his vassals, and the two Imperial Courts as his deferential allies. As Talleyrand told Alexander, who affected moral indignation against the captive King, adhesion to Napoleon or abandonment of his cause was a question of time. When Talleyrand, with the sanction of Louis XVIII., first attempted to form a combination against the annexation of Saxony, he seemed almost to stand alone. Lord Castlereagh cordially approved of the aggrandizement of Prussia in Germany, though he was irreconcilably hostile to the Polish projects of Alexander. The English Government would have heartily supported the restoration of Polish independence, but no serious politician could be deluded by the establishment of Poland as a dependency of Russia. The interests of Austria were almost equally affected by the proposed annexation of Poland to Russia and by the inclusion of Saxony in the dominions of Prussia. The two arrangements would have placed Bohemia and Austrian Silesia between the territories of two formidable, if not hostile, neighbours. Nevertheless Metternich offered but a feeble resistance to the confiscation of Saxony, and he allowed Alexander to believe that his Polish scheme would encounter no effective resistance. He probably relied on England to defeat the Emperor of Russia's designs on Poland, foreseeing that the claim of Prussia to Saxony would be fatally weakened by the failure of the Russian project of acquiring Posen. Lord Castlereagh ultimately found that the demands of Russia and Prussia were inseparably combined; and Metternich, who had perhaps only affected indifference, became an active promoter of the triple alliance which placed an impassable barrier in the way of the Russian and Prussian policy.

In his elaborate review of the negotiations of Vienna, Thiers arrives at the conclusion that the policy of Talleyrand was fundamentally erroneous. Faithful to his system of French aggrandizement, the Bonapartist historian holds that France ought in preference to have concurred in the ambitious projects of Russia and Prussia. It was not, in his opinion, the business of Louis XVIII. or of his Ambassador to protect Eastern Europe against Russian ambition, or to secure Austria against the dangerous vicinity of Prussia. The aggressive Powers would, he

* *The Correspondence of Prince Talleyrand and King Louis XVIII. during the Congress of Vienna.* With Preface, Observations, and Notes by M. G. Pallain. 2 vols. London: Richard Bentley & Sons. 1881.

think, have paid a high price for the aid of France, extending perhaps to the restoration of Belgium, if not of the German provinces on the left bank of the Rhine. There can be little doubt that Talleyrand had fully considered the various combinations in which he might have joined. His judgment was probably sounder than that of his brilliant and prejudiced critic. The march of a French army into Germany for the purpose of aiding Russia and Prussia against Austria would have caused universal alarm and indignation. Such a policy would have produced immediate war with England; and the Prussians themselves would have been shocked by the unnatural alliance. There is more plausibility in Thiers's contention that, if the French plenipotentiary had been less eager, England and Austria would have solicited his support; but, if the criticism implies that he might have successfully stipulated for a price for the alliance of France, Thiers is probably once more misled by his inveterate sympathy with French aggression. England, at least, would assuredly not have consented to enlarge the liberal conditions of the Treaty of Paris. One more respectable apology for the Prussian claim to the acquisition of Saxony was probably unintelligible both to Talleyrand and to Thiers. German patriotism, as it was understood by Stein, by Gneisenau, and by Niebuhr, had only an incidental connexion with the interests of Prussia. Some of the chief sharers in the war of liberation would not unwillingly have seen a powerful North German kingdom constituted under another dynasty. Approximation to German unity and security against French ambition furnished better reasons for the union of Saxony with Prussia than the supposed right of the King. Many Saxons would have preferred complete annexation to the division of the territory which was ultimately effected. It was not unnatural that the English Minister should support the cause of Germany against France, and also against the petty German Courts which had no share in the patriotic aspirations of their subjects.

After the return of Napoleon from Elba, Talleyrand rendered the King a final service of great importance by obtaining with difficulty the consent of the other Powers to the execution of the final Act of Treaty, including the signature of France. He perhaps scarcely regretted the declaration of all the Governments, including that of England, that they were fighting, not for the re-establishment of the Bourbons, but for their own protection against the usurping Emperor. If the restoration was not insured by a diplomatic guarantee, Louis XVIII. was to some extent relieved from the odium of allying himself with foreigners against his own subjects. It was eventually to the unhesitating decision of the Duke of Wellington that the King owed the recovery of his crown. When, soon afterwards, Louis XVIII. dismissed Talleyrand from his councils, he may perhaps have regretted the loss of personal intercourse with the most acute, the most sarcastic, and not the least courtly of Ministers. In the Vienna Correspondence the veteran diplomatist combines graceful flattery of the King with careful and subtle insinuation of his own political opinions. It is probably not without design that he consults the King's well-known taste by the satirical tone of his descriptions of the sovereigns and statesmen with whom he has to deal; but his contemptuous criticisms are at the same time probably congenial to his own character, and perhaps his uncomfortable position during the earlier part of his stay at Vienna may account for some unfavourable criticisms. He represents Castlereagh as sensible and upright, but as ignorant of diplomacy and Continental politics; yet the English policy of controlling the turbulence of France by the establishment of the kingdom of the Netherlands, and by the consolidation of the Prussian monarchy, was not a subject for ridicule. Both Louis XVIII. and his Ambassador refer with undisguised amusement to the zeal of the English plenipotentiary for the suppression of the slave trade. Talleyrand humoured Lord Castlereagh's philanthropic propensity by aiding his efforts in exchange for more substantial concessions with respect to Saxony and Naples. Of Metternich he invariably writes with contemptuous dislike, which is explained in part by divergence of policy. He frequently attributes the refusal of the Austrian Government to concur in the dethronement of Murat to the passion which Metternich felt or affected for the Queen of Naples. In her Memoirs Mme. de Rémusat declares that Murat owed to Metternich's sentiment for his wife his continuance on the throne for several years. She had evidently exaggerated statements which she must have heard from Talleyrand, who probably intended rather to circulate scandalous gossip than to convey serious information. In January 1814 the Austrian Government, with the assent of England, detached Murat from the cause of Napoleon by a recognition of his title. Down to the meeting of the Congress he had done nothing to forfeit the Austrian alliance; and Metternich was quite right in assuring Talleyrand that Murat, if he were only let alone, would insure his own destruction. It was not while Russia was massing a vast army on the frontiers of Austria that Metternich could have afforded a rupture with Murat, who had eighty thousand men at his disposal and who was known to be in close intercourse with Elba. As Murat only survived the treaty with Austria for less than a year and a half, Mme. de Rémusat's story almost exceeds the just limits of ladylike inaccuracy. The Correspondence, including an admirable State paper addressed by Talleyrand to Louis XVIII., who was then on his way from Ghent to Paris, is full of interesting matter. That the two volumes are issued without an index, and even without a table of contents, is probably due to the hurry or to the ill-judged parsimony of the publisher.

AUSTRALIAN ABORIGINES.*

THIS book is an extremely honest and, we believe, correct account of the Murri of Australia, as far as they fell under the notice of one of their best friends among the settlers. Mr. Dawson, aided by his daughter, a lady well acquainted with the native languages, has made a serious attempt to collect information about the traditions, customs, and beliefs of the Australians. Any authentic statements on this subject must be welcomed, because the Australian blacks are about as pure an example of a *Natur-volk* as we can now expect to find. Mr. Dawson has only accepted evidence when it was well supported by the joint testimony of several intelligent witnesses. They were proud of being asked to contribute to the book; and, when any native was succumbed to the temptation of punning on words, and so of deceiving his white friend, "the sedate old chief Kaawirn Kuunawarn at once reproved him, and restored order and attention to the matter on hand." Mr. Dawson has a high opinion of his native collaborators. They knew four dialects of Murri and English. On native law, natural history, and rudimentary savage astronomy, they were well informed. If kept away from drink, the black fellow has plenty of modesty, humour, common sense, and integrity. But whisky means with him selling his soul, his wife, his real estate, his health, and everything that belongs to him.

Starting with what may be called the political state of the Murri, we find them divided into local tribes, each tribe taking its name from some local object, hill, or river, or from some peculiarity of speech (like *Langue d'oc*, in modern France). In old times as many as twenty of these tribes would assemble at the common meeting, or *Amphictyony*, as the early Greeks would have styled it. Four dialects, or rather four languages, would be spoken at these assemblies, besides many minor dialects. The older blacks had usually a sufficient diplomatic knowledge of all the varieties of lingo. Mr. Dawson reckons that as many as two thousand five hundred and twenty people would be present at a time. Such numbers must almost have overtaxed the natural supply of food in the district.

The most singular political fact, and the one which we find it most difficult to credit, was the authority of the chief. Almost all travellers represent the Murri as chiefless men. The elders, the braves, the wizards, or medicine-men, are credited with varying powers, but hereditary chiefship seems an institution of a richer and more settled race. We have regarded the Australians as on a par, in the matter of political government, with the Eskimo and Fuegians, as commonly described. This opinion is strengthened by the evidence of Mr. Brough Smyth's large work. But the experience of Mr. Dawson has led him to take the contrary view. "Every tribe has its chief, who is looked upon in the light of a father, and whose authority is supreme. He consults with the best men of the tribe, but when he announces his decision they dare not contradict or disobey him." If this be true, at least of the savages of Victoria, their society is, so far, on an equality with that of heroic Greece. They have even a *noblesse*, which exists, we know, among the New Zealanders, but which we had supposed to be unknown to the more unpolished Murri. "No one can address a chief or chieftess without being first spoken to, and then only by their titles as such, and not by personal names, or disrespectfully." Again, the nobles have a power equal to that of taking any object they desire to possess. "Should they fancy any article of dress, opossum rug, or weapon, it must be given without a murmur." Mr. Brough Smyth says that "the principal man of a tribe acts only in such a manner as the old men and the sorcerers and the braves have agreed to approve." "He has no one he can call servant." But Mr. Dawson says:—"They can command the services of any one belonging to their tribes; as many as six young bachelors are obliged to wait on a chief, and eight young unmarried women on his wife," while the children are of superior rank, and "chiefs and their sons and daughters are married only with the families of other chiefs." It is evident that we cannot afford to dismiss the Australians as a race without distinction of ranks. Future students of the Murri, where they still survive, and are not greatly corrupted, should give particular attention to this point. What we need to know is the qualities which originally acquired for a family hereditary rank. Mr. Dawson distinctly says, "The succession to the chieftom is by inheritance," but an assembly of other chiefs elects the successor out of the descendants of the deceased leader, with a preference for the eldest son. The nature of real property in Australia should not be overlooked by the believers in a primitive communism. As in New Zealand and New Caledonia, community of landed estate is unknown. Equal partition among children of both sexes and the widow is the rule on the death of the father of a family. The chief appoints guardians for minors. These are advanced customs for a race so uncivilized that it actually possesses "no pottery or materials capable of resisting fire."

The Australian marriage laws have caused much discussion among students of the evolution of society. In reviewing Messrs. Howitt and Fison's work, we recently took occasion to point out that the evidence as to certain rules of restriction was extremely precarious. It is an ascertained fact that many Australian tribes have the Totemic law—that is, that men and women who carry

* *Australian Aborigines: the Languages and Customs of several Tribes of Aborigines in the Western District of Victoria, Australia.* By James Dawson. Melbourne: G. Robertson. 1881.

the same crest and abstain from the same animal or plant may not intermarry. This is the common rule also in America and some parts of Africa and Asia, while traces of it may be found in the history of civilised laws of prohibited degrees. But the Australians, or many of them, have another system of prohibitions, called "classes" by Mr. Fison, and by him supposed to justify the theories of Mr. Morgan. These theories require either a spontaneous moral reform by very early races or a divine interposition. The evidence is still far from sufficing to justify either hypothesis. Behind both lies also the unexplained origin of Totemism, for the "classes" appear, in many examples, to be merely forms of that widespread institution. On these points we quote Mr. Dawson's own words, though they do not quite succeed in making the matter clearer:—

As has been shown in the first chapter, the aborigines are divided into tribes. Every person is considered to belong to his father's tribe, and cannot marry into it. Besides this division, there is another which is made solely for the purpose of preventing marriages with maternal relatives. The aborigines are everywhere divided into classes; and everyone is considered to belong to his mother's class, and cannot marry into it in any tribe, as all of the same class are considered brothers and sisters.

There are five classes in all the tribes of the Western District, and these take their names from certain animals—the long-billed cockatoo, kuurokeetch; the pelican, kartporapp; the banksian cockatoo, kappatch; the boa snake, kirtuuk; and the quail, kuunamit.

According to their classes the aborigines are distinguished, as—

Kuurokeetch, male; kuurokaheear, female.
Kartporapp, male; kartporapp heear, female.
Kappatch, male; kappahheear, female.
Kirtuuk, male; kirtuuk heear, female.
Kuunamit, male; kuunamit heear, female.

Kuurokeetch and kartporapp, however, are so related, that they are looked upon as sister classes, and no marriage between them is permitted. It is the same between kappatch and kirtuuk; but as kuunamit is not so related, it can marry into any class but its own. Thus a kuurokeetch may marry a kappahheear, a kirtuuk heear, or a kuunamit heear, but cannot marry a kuurokaheear or a kartporapp heear. A kappatch may marry a kuurokaheear, a kartporapp heear, or a kuunamit heear, but cannot marry a kappahheear or a kirtuuk heear. A kuunamit may marry a kuurokaheear, a kartporapp heear, a kappahheear, or a kirtuuk heear, but cannot marry a kuunamit heear.

Here we get into the usual difficulties of terminology. It seems, from Mr. Dawson's account, that marriage within the local tribe of the father is forbidden. This is a novel kind of prohibition. Then marriage (as in the Totemic system) is forbidden within what Mr. Dawson calls "the mother's class," which we prefer to call "the Totem-kindred." That is, no man can marry a girl of his mother's crest, which he inherits, whatever the girl's local tribe may be, even though the pair are in no way related according to modern ideas. That the "classes" are Totemic Mr. Dawson proves by giving the names cockatoo, pelican, boa-snake, and quail, which answer to the wolf, boar, and turtle of the Iroquois. The women of the kindred simply add a feminine termination to the name. But we are quite thrown out when we come to the "sister-classes," as long-billed cockatoo and pelican, which may not intermarry, while the quail has no sister-class, and may intermarry with cockatoos, pelicans, and boa-snakes. This statement somewhat resembles one of Mr. Ridley's, which afterwards proved to be erroneous. The institution of "sister-classes" and of one "class" of especial privileges remains a mystery to us. Mr. Dawson would do a great favour to students if he would examine the facts again after reading through the works of Mr. Morgan, Mr. McLennan, and the rest of the controversy. It is a rather weary piece of work; but, as Mr. Dawson seems still unbiassed, and has means of observing facts, no one appears better fitted for the labour. As to the origin of prohibited degrees, the natives believe that the first father of the tribes was a long-billed cockatoo, who married a banksian cockatoo. Most savages trace a similar pedigree. The children were banksian cockatoos. They might not intermarry, and sought "fresh flesh"—that is, exogamous connexions. The sons got wives from a distance. And thus pelicans, snakes, and quails came in; but how the "sister-classes" were formed, tradition, as reported by Mr. Dawson, does not inform us. These most exogamous of black fellows will not marry a woman who speaks their own dialect. Commoners are limited to one spouse at a time. Chiefs may have as many wives as they think proper. Children are betrothed, to secure observance of the laws. As soon as a girl is betrothed, her mother and aunts are forbidden to speak to the lover. When they speak in each other's presence they use a special sort of slang, called in English "turn-tongue." Here is the manner of marriage, a ceremonial more distressing than aught that civilization tolerates in the same kind:—

The newly-married pair are well fed and attended to by their relatives. The bridesmaid, who must be the nearest adult unmarried relative of the bridegroom, is obliged to sleep with the bride on one side of the fire for two moons, and attend her day and night. The bridegroom sleeps for the same period on the opposite side of the fire with the bridesmaid, who is always a bachelor friend, and must attend him day and night. The newly-married couple are not allowed to speak to or look at each other. The bride is, during this period, called a tirok meetnye—"not look round." She keeps her head and face covered with her opossum rug while her husband is present. He also keeps his face turned away from her, much to the amusement of the young people, who peep into their wurn and laugh at them. If they need to speak to one another they must speak through their friends.

As is common among all savages, the mother-in-law and son-in-law resolutely "boycott" each other. There can be little doubt

that these rules of etiquette were originally devised to make unlawful amours impossible. But why a sin between a man and a woman of a kindred into which he might lawfully marry was so universally condemned is not an easy question to settle. We, of course, look on any criminal relation between a husband and his wife's aunts or mother as utterly abominable. But as all these women belong to a kindred into which a man might legally marry, we fail to understand the extreme precautions of the savage to prevent a crime which he might have almost been expected to tolerate. Infanticide is believed, by one of the best authorities, to be connected with the origin of prohibited degrees. Women were scarce, because they were murdered, and had to be looked for outside the family circle. It is a support to this theory that Mr. Dawson remarks, "girls are generally sacrificed." Mr. Fison, holding another theory, tried to prove that girls had quite as good a chance as boys. Husbands and wives always address each other in separate dialects, as the Caribs are said to do.

Mr. Dawson's remarks on the superstitions of the natives are less elaborate and valuable than the collection of Mr. Brough Smyth. But his whole work is so candid, so unbiassed by current speculations, and contains so many unexpected observations, that we heartily recommend it to the attention of students of the evolution of society. If Mr. Dawson had studied this topic more widely he might have modified some statements, but he could hardly have escaped the contagion of controversy and of theory-making. His philological appendix must be useful to people interested in the languages of Australia.

TWO PRETTY GIRLS.*

THE title of this novel accurately describes its subject. Two girls, both pretty, and one of them beautiful, arrive in London on the same day with the result, and in one case with the purpose, of being happily married either before the end of the season or in the following autumn. One of them has in the meantime had two admirers, and the other three; and both have for a time hesitated in their choice; but they ultimately select the proper candidates. The story is, as may be supposed, neither complicated nor extraordinarily exciting, but it is pleasant, cheerful, and readable, and it contains both agreeable conversations and natural sketches of character. An attentive critic might perhaps collect some indications of the writer's personal opinions. Miss Lewis attributes to her most intelligent personage the sound reflection that a person brought up in solitude would be much more fit to live in the world if he had read nothing but novels than if his studies had been confined to history. More ambitious inquirers into the nature of useful knowledge have formed the same conclusion. Few students of character and manners can have commanded in actual society the range of observation which is provided in the boundless variety of modern fiction. It is true that the picture of life presented in novels is incomplete and often inaccurate; but genuine impressions reproduced by scores or hundreds of more or less original writers must contain a considerable amount of truth. Many novelists have but an incomplete claim to the character of artists; but art, when it is not wholly wanting, is more readily understood than the nature which it undertakes to interpret. An actor who has any trace of histrionic faculty brings out some meaning in his text which would escape the notice of a prosaic reader. The great masters of fiction exhibit a similar faculty in a higher degree. Ordinary readers are scarcely aware of the help which they derive from their skilful instructors. They might themselves in real life have seen in Dugald Dalgetty a mere mercenary adventurer, and they would never have discovered that Mr. Shandy was a man of genius. The skill with which thoroughly commonplace characters are brought out in full relief is not less admirable. Of all the personages in *Vanity Fair*, with the exception of Becky Sharpe, George Osborne, the selfish, dull, well-dressed walking gentleman, is perhaps the most remarkable product of creative skill.

Miss Lewis deserves credit for her successful treatment of a commonplace and unattractive character. Of her two "pretty girls," the first heroine is well born, well principled, well-mannered, and endowed with a competent fortune. Possessing, as becomes her condition in society and in the story, every virtue and every grace, she makes but one temporary mistake in encouraging a suitor who had been notorious as a scamp before he was discovered to be a swindler. The judicious reader watches the risk which she incurs with little anxiety, because he perceives that she was eventually destined for an objectionable young gentleman, whose typical name of Sir Walter Grenville implies his position as first lover. The other and prettier girl is ill-educated, not delicately scrupulous, and penniless; and her chief anxiety is to escape from a home of which the coarseness is unpleasantly and extravagantly caricatured. Ladies who write novels are for the most part like other ladies familiar with only one kind of social experience. Some of them blunder strangely in their representation of the manners and customs of the classes which belong to so-called society. Miss Lewis is evidently not less dependent on vague conjecture when she describes a needy professional home in a country town, or the gorgeous establishment of a rich London stockbroker. If she had the opportunity of con-

* *Two Pretty Girls*. By Mary A. Lewis. 3 vols. London: Richard Bentley & Son. 1881.

suiting competent authorities, she would learn that the middle class, whether rich or poor, is not necessarily quarrelsome and rude at home, or offensively hypocritical in its intercourse with the outer world. Respectable matrons, struggling to bring up families on narrow means, are probably not in the habit of ejaculating "My!" nor would one of their daughters betray to a suitor the secret that her sister had been at one time ready to accept him. Exclusiveness is perhaps unavoidable in the present state of society; but there is no reason why the inmates of a privileged circle should cultivate animosity and contempt for their less fortunate neighbours. The mistrust which has in different parts of the world identified savages and frontier tribes with demons seems still to survive among separated classes. The vicious outcasts from aristocratic society in the *Two Pretty Girls*, of whom nevertheless one family possesses 15,000*l.* a year, are scarcely more true to nature than the tyrannical earls and profligate baronets who are said to adorn the pages of plebeian fiction. In the particular case of the second heroine, daughter and sister of the townspeople who say "My!" Miss Lewis is more tolerant, more observant, and, therefore, more true to nature. Christine Ransome, who had at the beginning of the book all but accepted one of the demon tribe who kept a provincial shop, at the end of the third volume makes a not wholly unsuitable marriage with a clergyman of good family and fortune. The change is effected, not by any conversion to higher principles, or by any important modification of character; but Miss Lewis allows the young woman's manners to improve, and teaches her to conceal her defects by the operation of exclusive intercourse for a short time with good society. A quick and clever girl may, perhaps, acquire an appearance of refinement the more quickly because her attention is not distracted by troublesome processes of moral reformation. Christine's distant connexion, Lady Loder, had asked her to London in consequence of the well-founded report of her beauty, and her guest had the good sense to profit by her lessons and hints, even when they were most uncomplimentary. After a rebuff on their first interview, she understood that she must not boast that her father and mother knew many county people, or that they had the year before dined with the Lord-Lieutenant. At the first ball, Lady Loder, an eminently sagacious woman, cautioned her to listen to women, but to say little, lest she might betray her unhappy training. She was at liberty to talk to her partners, because, as Lady Loder wisely observed, men never find such things out. In a month or two Christine had acquired so much of the rudiments of civilization as to be shocked at the manners of her rich cousin, the stockbroker's wife, and of her odiously vulgar son. After some hesitation she has the good taste to prefer the well-bred clergyman, Mr. Carew, to the young stockbroker, whom his happy rival not unjustly condemns as a "cad." Mr. Carew's sensible sister-in-law and chief adviser regrets his preference for Christine over the first heroine, Maud Loder, but she judiciously acquiesces in a choice which might not improbably have been made in real life. The external improvement which takes place in Christine is the best part of the book, though Miss Lewis, with judicial severity, frequently directs attention to the continuance of her moral defects. It is to be hoped that Lady Loder's moral apophthegm applied to intimate companionship as well as to the relation of partners at balls. In that case Mr. Carew, like men in general, "would never find these things out." Indeed, the impartial bystander spends his life in wondering how some husbands can tolerate their wives, or some wives their husbands. It is possible that Mrs. Carew, having completed her course of external improvement, may have gradually acquired some of the qualities which she had learned to appreciate and to assume.

The course of true love runs tolerably smooth in the case of the more refined and more estimable heroine. The villain of the story, whom she had too hastily encouraged, unlike the ordinary villains of fiction, disappears into outer darkness in the second volume. She is herself for some time unconscious of her own liking for the amiable young gentleman who had in the first page or two clearly intimated to the experienced reader his future fortune as the destined winner of the prize. For the purpose of delaying a final explanation, and perhaps also to mark the date of the book, Sir Walter Grenville has to be shot through the arm by an Irish tenant, who had first murdered the agent and then tried to set fire to the landlord's house. The interval is occupied by the settlement of Christine's affairs, and by reports of balls, parties, and conversations, which, as Mr. Carew says, would be better adapted than history to qualify a hermit who had always lived in wilds remote from public view for polite society. Miss Lewis is much more at home among gentlemen and ladies than in the humbler circles which, as she imagines, are abandoned to hopeless vulgarity; and ugly objects, even when they are not fabulous monsters, ought always to be avoided by artists. That Miss Lewis has studied books to some purpose as well as character and manner may be inferred from the quotations which serve as mottoes for her chapters. It would be too much to hope that Longfellow should be wholly avoided. Many well-chosen passages from authors of a higher order indicate, both in their selection and their application, sound taste and solid judgment.

NEW COLORADO.

"THE extraordinary development of the mineral resources of Colorado during the last three years," writes Mr. Hayes, "has rendered most of the books useless which have been previously written about that region. This volume," he goes on to say, "may therefore be held to supply a manifest need." While he thus seeks to lessen the value of the works of earlier travellers, we cannot believe that, with the ordinary reader, at all events, he takes the right way to recommend his own. Books of statistics, no doubt, are superseded with great rapidity in a rising country; but books of statistics are only meant for a certain class of students. "Bunkum"—if we may borrow a piece of Yankee slang—gets out of date even faster than statistics. In the fast-growing States of the interior of America it must want renewing at least every year. Thus the passage in which Mr. Hayes sets forth the great glory of Kansas will have lost its force as soon as the next Report is issued of the Secretary of the State Board of Agriculture. "In 1866," writes our author, quoting from that document, "Ohio produced 10,200,000 bushels of wheat, and Kansas 260,000; in 1872 Ohio produced 18,200,000, and Kansas 2,100,000; in 1878 Ohio produced 32,000,000, and Kansas 32,300,000." The repetition of the word "produced"—especially if the reader reads it aloud with a Yankee twang—has a certain solemn effect. But it is an effect that cannot outlive the publication of fresh statistics. The same fate awaits another passage, in which is set forth the spread of vegetables. "In 1845," Mr. Hayes says, "vegetables could not be grown at Topeka . . . in 1870 they could not be grown at Newton; in 1872 they could not be grown at Larned. In 1879 they could be grown at Dodge City." Our knowledge of geography, we confess, is not extensive enough to allow us to feel the full surprise of the climax. But we feel sure that the next generation will look down with contempt on the boast about Dodge City. The limit of the growth of the cabbage and the onion will have been extended to districts as yet unnamed that are now known only to the tribes of wild Indians. If, therefore, books are to be set aside by the extraordinary development of resources, whether mineral or vegetable, the work before us can count only on a very brief life. In another three years it may have reached the extremity of decrepitude. Mr. Hayes in one passage seems to be aware of this, yet when he records the doings of the Colorado troops in 1862, he says that the account is "given in permanent form as a contribution to the history of the country." But what form can be permanent in a land where only one three-years' development of mineral resources sweeps away a whole literature, and where vegetables which a short while ago would not be grown at Larned can now be grown at Dodge City? Even the Female Seminary which is at present one of the glories of Topeka will some day or other be looked upon with contempt, though, "for strength and thoroughness of building and convenience of arrangement, it surpasses many of the most pretentious ones of the East." It was in Topeka that, so late as 1845, vegetables could not be grown. Does Topeka boast of its vegetables now? Does it regard a potato with any feeling of triumph, or does it glory in a radish? In another thirty-five years will it boast of its Female Seminary? Long before that time its females will have developed into ladies, and its Seminary into a University.

Full, no doubt, of such sad thoughts as these, and impressed with the overwhelming force of the growth of statistics and the spread of vegetables, Mr. Hayes has done wisely in seeking to keep his volume a little longer afloat by adding to its lightness. He not only indulges in jokes himself, but he makes use of a humorous companion, who adorns his book with a series of sketches. The artist has one great advantage over the author. His comicality—whatever it may be worth—can be enjoyed at a glance. No wading has to be gone through in order to reach it. Now Mr. Hayes's jokes, on the contrary, lie scattered about, and are often found somewhat widely apart. He would have done wisely had he printed them in a different type, or had he in each case shown his readers by a side-note where one was to be found. As he has not done this, it is only too likely that many will break down in the attempt to reach the first of them, just as many an emigrant has broken down on the wide and dull prairie in his attempt to reach Colorado. Mr. Hayes's natural style is uncommonly heavy, and seems in many places to have been founded on a careful study of the advertisements of auctioneers. It is after the following fashion, for example, that he begins his description of Colorado:—

This whole unique domain, of 106,475 square miles, may, with the exception of the extreme south-western corner, in which are the curious ancient ruins and cliff-dwellings of the Mancos Cañon, be called essentially a new country; since its white inhabitants (whom, pending the new census-taking, we will estimate as numbering 200,000) have all either been born, or immigrated, within some twenty years.

In describing the town of Colorado Springs, he writes:—"It lies on a little narrow-gauge railroad, . . . destined and confidently expected, say its friends, to establish its ultimate terminal station in one of those 'halls of the Montezumas' of which we so often hear." He praises the life of a cattle-ranchman as possessing "the utmost fascination for men thoroughly accustomed to the

* *New Colorado and the Santa Fe Trail*. By A. A. Hayes, Junr., A.M., Fellow of the American Geographical Society and the Royal Geographical Society of London. Illustrated. London: C. Kegan Paul & Co. 1881.

resources and habits of the highest and most refined civilization, and presumably liable and likely to greatly miss them." Our readers will allow that it will require a great deal of light matter to reward them for going through many pages written in such a style as this. He who shall try but a very few pages of it will be presumably liable and likely either to fall sound asleep or to lose his temper.

Mr. Hayes had scarcely started on his travels before he found himself promoted to the rank of Colonel. In the Western States "the traveller," he says, "should make up his mind to accept without demur such military or judicial rank and title as may be conferred upon him." By the following story he shows the mode in which titles are given and altered:—

"I don't half like," once remarked a Scotch fellow-traveller of the writer, to a friendly group at Denver, "the promotion backward which I receive. East of Chicago I was Colonel; at Chicago I was Major; at Omaha a man called me Captain, and offered me dinner for thir-r-ty-five cents!"

One of the group, after a careful survey of the face and figure before him, the kindly yet keen expression, and the iron-gray whiskers, replied: "You ain't Colonel wuth a cent. I allow that you're Judge!"

And "Judge" he was from that time forth. Nobody called him anything else. Newly made acquaintances, landlords, stage-drivers, conductors, all used this title, until his companions began to feel as if they had known him all his life in that capacity.

While our author was thus made a Colonel, his companion, the artist, became a Commodore. The sketches of the gentleman who was thus enrolled in the navy form by far the best part of the book. In themselves, though they are lively and now and then pretty, they are not of any very great merit. But, set as they are in the midst of a dull narrative, they are found to have unusual attractions for the reader. The two friends travel from place to place, and while one has his pen in his hand the other has his pencil. Early in their journey they come to an arid plain, and the Colonel enlarges on "the power of that great beneficent agent, Water." A dignity, it will be noticed, is conferred upon it by giving it a capital letter. In England, where it is an intolerable nuisance, it is never similarly honoured. The artist, by the way, forgets to give a sketch of the great beneficent agent. They arrive at the house of a cattle-farmer, and they see "an æsthetic phase of the ranchman's life." This is a subject which admits of easy illustration, and so we have the picture of three gentlemen, one in his shirt-sleeves, listening to a sentimental lady playing on a guitar. But surely when the travellers had once crossed the Missouri they might have well left "æsthetic phases" behind them. Such language, ridiculous as it is anywhere, has a doubly ridiculous sound in a description of the wild life of a Colorado cattle-breeder. They presently hear of some very great men. One had begun fifteen years ago with a capital of 100 dollars, and his estate is valued now at 1,500,000. The Lieutenant-Governor of the State was once a small storekeeper. "He 'grub-staked' some prospectors," and is now "credited with indefinite millions." Such men as these—and there were more than one of them—"are doubtless competent," to quote Mr. Hayes's words, "'to give a reason for the faith that is in them,' and amply support the wisdom of their choice of location." Mixing on friendly terms with these illustrious Americans may be found "gentlemen who will talk, with faultless Piccadilly accent, of the last gossip from London." Has Piccadilly an accent of its own? We confess we did not know it, but then we have never travelled in Colorado. Some of these Piccadilly gentlemen—scions of the nobility and aristocracy of Great Britain, as Mr. Hayes calls them—do not, we regret to learn, conduct themselves with perfect propriety in Colorado. A gentleman from the Eastern States, calling on a lady "to whom the conveniences of life were traditionally dear, apologized for the absence of his companion, whose clothes suitable for such an occasion had been delayed by the expressman." We may wonder, by the way, what is the costume which a gentleman ought to wear who pays a call in Colorado. It is clearly something different from the dress in which a man goes a journey by railway. But to return to the lady of the traditional conveniences. "Only hear that!" she delightedly cried. "Why, I have been meeting the sons of dukes and earls with their pantaloons tucked in their boots." This is a melancholy and a humiliating picture. These scions of the nobility and aristocracy might at least have worn knickerbockers, and then they would not have been even tempted to put their boots to so very improper a use. We could have wished that the artist had given us an illustration of one of them. He might have headed it "An Unæsthetic Phase in Colorado; or, the Boots and Pantaloons of the Son of a Duke." In one passage Mr. Hayes compares his country very unfavourably with ours. A Republic, he says, treats its soldiers with ingratitude. For the battle of Gettysburg Meade was only made a brigadier-general, while Wellington was rewarded for Waterloo with a dukedom. As our author is praising us we must not find fault with his history; but surely there are two sides to the question. Gratitude in a nation is a fine thing, but if there were no dukes there would be no dukes' sons; and if there were no dukes' sons there would, likely enough, be no rude young men to call on a lady in Colorado with their pantaloons tucked into their boots. Let him therefore judge his own country more kindly, and remember that in a Republic, if there are no exalted dignities to reward gallantry, on the other hand there are no scions of aristocracy and no boots with pantaloons tucked into them to be seen in a lady's drawing-room.

A prince can make a belted knight,
A marquis, duke, and a' that.

But it is above his might to make a man wear his boots and his pantaloons in a way that shall satisfy a lady to whom the conveniences of life are traditionally dear. The United States are seen, therefore, to be wise in their apparent niggardliness; and Mr. Hayes, even when he compares Wellington and Meade, may well be proud of the Republican institutions under which it is his happiness to live. We could wish, however, that, while his manners are so good, his book were not so uncommonly dull. We can recommend it heartily to the sons of dukes and earls; but all others, from viscounts downwards, will be able to get little from it by way either of instruction or amusement. Those, however, who are thinking of going to Colorado for their health—and as a health resort it seems almost unrivalled—will find a useful chapter at the end of the volume. In it Mr. Hayes gives a good deal of medical information. He has, moreover, drawn up a table of the various routes from New York which will, no doubt, be of considerable service to the traveller.

OLDFIELD'S NIPÁL.*

THESE two volumes contain a large mass of valuable information, acquired during a residence of fourteen years at the capital of Nepal. As Residency Surgeon, the late Dr. Oldfield enjoyed opportunities of observation little if at all inferior to those of the civilian or military officer of high standing who usually fills the post of Resident. But the materials are somewhat disjointedly put together, and would have been better for rearrangement and revision. The want of maps is positively heartbreaking. The earlier chapters are devoted to a minute physical description of the country, and, to say nothing of obscure provinces and inaccessible divisions, there are enumerations of numberless rivers, passes, and *dhums* or valleys at the foot of the Himalayan ranges, which are perplexing and unintelligible from this mere omission. The work is, however, full of facts intelligently observed and faithfully recorded. Dr. Oldfield's profession placed him on terms with Jung Bahadur and his family almost approaching to social intimacy. The peculiarities of Buddhist architecture are brought home to the reader by coloured illustrations; and there are happily no pungent remarks at which any of the most sensitive and jealous of Indian potentates could take offence. An account of a people and country governed by a ruler who still retains his inviolate independence of British authority in all internal affairs could not fail of interest; and in the whole two volumes, with the exception, perhaps, of an account of the rise of Buddhism in India proper, there is little or nothing taken at second-hand.

Nepal, which the author derives from two words, signifying "under the protection of the Deity," is a mountainous kingdom extending about five hundred miles along the southern slope of the Himalayas, and averaging in breadth about a hundred miles. Its population is variously estimated at from four to five millions. The kingdom is much cut up by lofty ridges. Part of it is covered with dense forests, and there is no lack of malaria which generates a deadly fever locally known as the *aval*. The scenery in many places is picturesque and grand, and the climate at Katmandhu, some 5,000 feet high, is enjoyable. The revenue of Nepal has been estimated at rather less than half a million of our money, but for this there are no reliable data. The commerce is insignificant, and is in the hands of some fifty traders, who reside at Katmandhu and the neighbourhood. The blankets of Nepal have been renowned from the earliest Hindu times; and gold dust, precious stones, rock salt, and Yak tails, are brought down from Tibet on the backs of sheep. Originally the kingdom was possessed and governed by Newars, who were Buddhists though the Newar reigning dynasty was Hindu, and claimed descent from Rama. But the modern history of Nepal dates from little more than one hundred years back. In 1769 the Goorkhas came down from the district of Gorkhali, some fifty miles from Katmandhu, under Raja Prithi Narayan, drove out the Newar dynasty, and established themselves as rulers of the country. Our first attempt at intercourse with Nepal was purely commercial; but neither Lord Cornwallis nor Lord Wellesley was able to negotiate a lasting treaty or to retain an English Resident at the capital. The attitude of the Nepal rulers was for years marked by the most intense distrust and suspicion of our proceedings. This culminated in the Nepal war of 1815; and it is only owing to the delicate management and forbearance of our successive representatives that this jealous feeling has at all been overcome. With their eastern neighbours the Goorkhas have not been very fortunate. The Goorkhas had to endure numerous insults and injuries from the Tibetans; and every five years presents for the Emperor of China are sent to Peking via a Nepalese Embassy, the members of which are invariably subjected to divers slights and inconveniences at the hands of Celestial mandarins and Governors. At the close of the last century a Chinese general actually came within a few miles of Katmandhu with a victorious army and there dictated to the Goorkhas the terms of an ignominious peace.

Dr. Oldfield appears to have left behind him an essay on Budd-

* *Sketches from Nipál, Historical and Descriptive; with Anecdotes of the Court Life and Wild Sports of the country in the time of Maharaja Jung Bahadur, G.C.B., and an Essay on Nepalese Buddhism.* By the late Henry Ambrose Oldfield, M.D., many years Residency Surgeon at Katmandhu. 2 vols. With Illustrations. London: Allen & Co. 1880.

ism, which had no necessary connexion with his other experiences, but which the editor has judiciously published as throwing light on the social history of the country. Into the rise of Buddhism in India, into the reformation of a degraded Hindu faith under the preaching and example of such a reformer as Sakya and such a monarch as Asoka, into the revival of the Brahminical power, and the corruption of the purer and higher morality which had annihilated caste and discouraged sanguinary rites and coarse idolatry, we shall not enter. But the contact of Hindus with Buddhists in Nepal has produced such curious consequences that we desire to give some prominent notice to this portion of the second volume. Whether Sakya the saint or Asoka the king ever visited Nepal in person is comparatively immaterial. What is quite certain is that Nepal is full of mound-temple, of images of the Buddhist triad known as the Tri-Ratna, of the five or six divine Buddhas, of a long train of eminent saints and ascetics, and of sculptures representing the thunderbolt, the bell, and other mystic emblems. The religion which these symbolize is the Theistic as distinguished from the Materialistic Buddhism; but though this is obviously the higher and more spiritual belief, it is being gradually undermined and corrupted by the worship of Shiva and other Hindu deities. Caste has reappeared. The Hindu Newars retain the fourfold division of ancient castes, and the Buddhist Newars, who form two-thirds of the population, have created orders or divisions which correspond to the priestly, the mercantile, and the agricultural classes. These castes, again, have their sub-divisions. The Banhras, who answer to the Brahmins, follow nine different callings; monks and ascetics no longer exist; monasteries have become guilds; and a class of heterodox Buddhists has arisen which performs service at Hindu temples and adopts Brahmanical ceremonies and forms. Buddhists have even got so far as to excommunicate some of their own faith who follow monial and degrading occupations, and with such they will neither intermarry nor eat. It is so far creditable to the partisans of these rival and contradictory creeds that they live together in the same cities without intolerance and animosity. We hear nothing of those fanatical outbursts which are so common in India, under the very eyes of policemen, magistrates, and Commissioners, and which nearly always originate with the slaughter of a bullock close to a Hindu temple, or the defilement of a mosque with the carcase of a pig. Buddhist Newars have their great religious festivals, of which Dr. Oldfield gives a list at page 292, vol. ii., but we own that it seems to us difficult to make out how they differ from Hindu performances. In some of them honour is paid to Bhairava, an incarnation of Shiva; in others, to Devi as Bhairavi; in some, to the Lingam; and in others, again, to the cow. This last the author actually divides into two distinct portions, alleging that the cow is worshipped by Hindus for one day in the public streets, while the Buddhist devotion is paid afterwards inside the Vihars. All the above seem to be quite distinct from the well-known Hindu festivals of which we hear so much on the plains—the Ram Nabbomi, or birthday of Rama; the festival in honour of Narayan, a form of the god Vishnu; the Dewali, with its illuminations, gambling, and worship of dogs and cattle; the Dassarah and its hecatombs of slaughtered buffaloes; and the Hooli, with its red powder, vulgarity, and obscenity. Somehow, we regret to observe, Hinduism manages to debase everything material or moral with which it is closely allied. *Nihil tetigit quod non fœdavit.* Its sculptures are hideous, its stories sensual, its pictures indecent, and its ceremonies dictated by lust or by cruelty. Dr. Oldfield gives a graphic but repulsive account of the sacrifices of buffaloes, at which dancers, called “Dharmis”—literally “religious persons”—drink copious draughts of the warm blood of the reeking victims. A purer faith, based on the equality of all persons, on purity of intention and thought, and on meditation on the attributes of the Divine intelligence, has, in Nepal at least, no chance against one which depends for its success on costly sacrifices, pride of birth and position, and gorgeous display. We are not disposed to question the accuracy of the author's prediction that in one hundred years' time Buddhism, as a separate religion, will cease to exist in the Nepal Valleys. Nor can we have reason to complain if mere outwards forms are not to survive the extinction of all that was sound, elevating, and ennobling in the doctrines of Gautama.

Accounts of the character, habits, and general policy of the remarkable Minister who for thirty years dictated the policy of the Katmandhu Durbar will for most readers have greater attractions than the mere enumeration of castes and festivals or the description of intricate valleys and lofty ranges. And in these volumes the late Jung Bahadur stands out as a strong character, disfigured indeed by several of the Oriental failings, but far-sighted, vigorous, and inclined to temper despotism with more mercy and forbearance than we might expect. The father of Jung Bahadur rose to distinction in one of those conspiracies of which we hear so much at intervals. He cut down a man named Sher Bahadur, who had attacked the Raja, and for this “act of gallantry was permitted ever afterwards to wear his shield at Court in the Raja's presence.” Up to 1843 Jung was biding his time in retirement, but in that year he made his appearance at Court under the protection of Martabar Sing, his uncle. In 1845 Martabar, like so many other Prime Ministers of that country, was murdered, and Jung was accused of complicity in the murder. Sir Henry Lawrence, our Resident at the time, seems to throw the blame on Gaggun Sing and four others. If Jung, who began by denying all knowledge of the crime, ended by boasting that he had fired the first shot, his

boast may have been prompted by a wish to frighten others, or else by the feeling that led old John Gudyill to give out that he and not Oddie Headrigg had shot Basil Ollivant in *Old Mortality*. It is at least certain that in Vol. II. of Sir H. Lawrence's *Life the Queen* is stated to have been in the plot, and Jung is only mentioned as “riding out in a buggy with the murderers of his uncle”; and he may have done this afterwards from sheer caution. How Jung became supreme is very clearly told by Dr. Oldfield. There were three parties in the State about the year 1846. The Queen, backed by Gaggun Sing, wanted the Regency for herself and the succession for her son. The Raja—that is, the titular king—a weak and vacillating creature, relied on a chief named Futtah Jung, who was nominally Premier. Jung himself was inclined to support the heir apparent. This state of things could not evidently last long, and disputes came to an end by the murder of Gaggun Sing at the hands of an intriguing Brahman, and by that of Futtah Jung at the hands of Jung Bahadur's followers. The excuse for Jung's conduct is that, in all human probability, he would have been shot himself if he had not anticipated his opponents. His ascendancy, his overthrow of the King, his conduct during the second Sikh war, his reception of the famous Rani Ohunda Kunwar of Lahore, his visit to England in 1850, and the insight which he gained into our power and resources, are more or less known. It may be said that the latter event was the turning point in Jung's life and materially influenced his conduct in the Mutiny. He knew the boundless capacities of England, which the Sepoys, the Nanas, and the Moulavis did not. A politician of his extreme sagacity saw, too, that one who had been received and fêted by the Queen and the aristocracy must not be cruel or excessive in retaliation. When some misguided opponents gave out that he had lost caste in England and plotted his assassination, he arrested the criminals, refused to resort to the axe or to the blinding needle, and politely requested Lord Dalhousie to confine the plotters at Allahabad. He discouraged Suttee and abolished the punishment of mutilation; he ordered a salute to be fired on Queen Victoria's birthday and minute guns on the death of the Duke of Wellington. Numerous instances of his skill and coolness in field sports are given by Dr. Oldfield. He could track elephants almost as well as his own mahouts, and fast for hours while in pursuit of game; and his manoeuvres for enclosing elephants in a stockade or for beating the forest for tigers and deer were planned with a foresight and carried out with a carefulness that would do credit to any general commanding at a Volunteer review. He has been known to confront leopards on foot with no other weapon than a very sharp sword, and, though cautious and reserved on public questions, nothing could be more kind and considerate than his manner to Englishmen whom he liked and respected. Once Dr. Oldfield had gone out very early with the Prime Minister after leopards, and had incidentally remarked that he had started without breakfast. Nothing was said, but a horseman was quickly despatched to the palace, and in a short time a carriage met the sportsmen with a capital hot breakfast—pilaus, cutlets, stews, grilled pheasants, cracknels, and fruits. Jung's conduct during the Mutiny, though somewhat criticized at the time, ensured for him the graceful recognition of Lord Canning. He was made a G.O.B., and a tract of territory on the frontiers of Oudh, highly valued for sporting purposes, which had been taken by us after the war of 1815, was restored to Nepal. Yet it must not be imagined that behind all this courtesy and the hospitality which he showed to the Prince of Wales, there was any real desire for a closer social and commercial union with that mysterious Power, of whose progress from the Jumna to the Indus he had been no unconcerned spectator. To the last year of his life Jung had the strongest aversion to any measure that tended to “develop” or “open up” the country. Nothing would persuade him of the virtues of coal or cotton, minerals and mining, or would make him look on commerce as anything but a prelude to empire. Consequently the road from the capital to the plains of Tirhoot is still a mere track. No invitation is held out to independent Englishmen to settle in the country. The movements of the Resident are carefully watched, and it is only by tact and dexterous management that he is enabled to see anything of the interior, and to scan the condition of the people while he is apparently intent on jungle fowl and deer. It is perhaps not unnecessary to add that this state of things can never be amended by despatches and communications of a high-handed and violent kind. Nepal sends no tribute to the Indian Treasury; is internally independent; and, beyond engagements to surrender criminals, not to place more than certain duties on a long string of exports and imports, and not to employ any Englishman, American, or European in its service, it pays none of those marks of feudal obedience which we are so familiar with in the cases of numerous potentates anywhere in India between the Himalayas and the sea. There is not the smallest necessity for discussing the difference between suzerainty and sovereignty as regards Her Majesty and the Nepal Durbar. The country is “*Nec pecori opportuna sages, nec commoda Iaccho*”; commerce is uninviting and inexpansive; and if picturesque tracts, dense forests, literature and language, and the curious admixture of Buddhist and Hindu customs, are ever to become better known to us, that knowledge will only be available by the labours of such men as the late Dr. Oldfield and Mr. Brian Hodgson, who can collect facts without exciting surprise. Any attempt to dragoon the successors of Jung Bahadur into a change of policy would only end in irritation, discredit, and failure. For-

fortunately our negotiations with the Court at Katmandhu are now in the hands of a gentleman who graduated in statecraft and the management of Indian princes under such Viceroys as Lord Lawrence and Lord Mayo.

GOMME'S PRIMITIVE FOLK-MOOTS.*

ON the subject of "The Primitive Folk-Moots of Britain" Mr. Gomme has written a laborious work, which, he bids us observe, "chronologically . . . holds a place prior to any existing works on English History, because it treats of a period of history prior to any that has been yet undertaken." After this announcement, the reader, on glancing over the pages, may perhaps be surprised at finding himself among the familiar scenes of the Icelandic Thing, as described in Dantsen's *Burnt Njal*; the Free Court of Corbey, as described by Sir Francis Palgrave; the Northumbrian Witenagemót of 627, as described by Bæda; the folk-moot on Penenden Heath, described by Mr. Freeman and others; and the meeting of John and the Barons at Runnymede, which is recorded, we believe, in all histories except Shakspeare's. When at last the reader lights upon the Berkshire widows riding into court upon black rams, as recorded in Nos. 614 and 623 of the *Spectator*, we may well ask if this too belongs to "a period of history prior to any that has yet been undertaken." If, moreover, he has skipped the preface—a wrong, but not an unusual, course—he may find it difficult to make out what the author is driving at. Mr. Gomme has compiled a mass of information, often curious and valuable, about folk-moots and local courts, but he has not the art of so disposing his facts as to show what their bearing is. The preface, however, makes it clear that Mr. Gomme has a theory, and to some extent it explains what that theory is, and how the evidence he has collected bears upon it. We will let him speak for himself:—

Now, from the long series of instances of open-air assemblies in Britain, I have built up an historical theory concerning the Primitive Folk-moots of Britain. This theory is based, I believe, upon the strongest possible foundation; it is an induction drawn from a very wide circle of facts. But in every instance I have sought to keep my facts as complete as possible—topographically, historically, and politically. My first care has not been the proof of my historical induction, but the collection of all the known or possible instances of the open-air assembly in Great Britain which I could come upon during a long period of research. And if, with these fragments of antiquity, I have endeavoured to build a fabric which, as I submit, gives us an important picture of primitive times; if my argument throughout is that these open-air assemblies are survivals of primitive open-air assemblies, I am dependent for proofs of this argument upon the evidence given by the collected examples as they stand in English history or tradition at this present day, instead of the more strictly scientific data afforded by an archaeological arrangement of the primitive features only of each example.

Mr. Gomme's theory, in short, appears to be this:—That the distinctive feature, or at least a distinctive feature, of the primitive assembly is the meeting in the open air under the light of heaven, and that wherever we find trace of an open-air assembly we see before us a survival of the primitive assembly. Against this view we have nothing to object; all we remark is that Mr. Gomme hardly makes good his claim to be the historian of a period "prior to any that has been yet undertaken." He deals with survivals of a primitive period, not with the primitive period itself. There is moreover a haziness in his method of treatment which renders it difficult to form any opinion on his work. He tells us that "sociological science requires a sociological medium, through which to observe the institutions of civilized countries in their primitive condition." If we do not always understand him, it is probably because we are not accustomed to look through "a sociological medium," which would seem to be something akin to smoked glass. He talks of "the primitive history of Britain" without satisfactorily explaining whether he means Britain in the geographical or in the historical sense. His "primitive political institutions" in many cases seem to be, not British, but English. But when he observes, with reference to Mr. Freeman's *Comparative Politics*, "his researches with regard to Britain . . . are less comprehensive and less satisfactory than those with regard to Teutonic countries," it is clear that here Celtic Britain must be meant. We gather that Mr. Gomme, while rejecting "the theory of the exclusive Roman origin of English history," yet does not wholly accept that of "an exclusive Teutonic origin," but believes that "an early Celtic occupation and a Roman conquest" must be taken into account in the history of English institutions. Further on, he expresses himself more decidedly with regard to Rome. "Her civilizing influences not only varied the primitive institutions of the Celtic Britons, who preceded her, but also the primitive institutions of the Anglo-Saxons, who followed after her." But it is not always plain whether Mr. Gomme is thinking of the material influence of the Romans as conquerors of Britain, or the later moral influences of Rome upon the English. Take the following passage:—

All these Roman influences upon the central governing authority—upon the Teutonic-founded Witan and upon the new kingship and the new ceremonial—left the local communities to do almost as they would have done in old times, and to develop almost as they would have done if no Roman power had swept over them.

Now no Roman power had ever swept over the English local

communities, simply because the Romans had swept themselves out of the land before the English tribes came into it. From this passage we can only conclude that Mr. Gomme holds that the English local communities were evolved out of the Celtic local communities which had preceded them—a view which we need hardly say is rejected by our foremost historical scholars.

Thus much of the author's theory; we now turn to consider how he has worked it out. At first sight it seems somewhat unreasonable that Kemble and Mr. Freeman should be blamed by implication for stepping on to German and Swiss ground, and that Mr. Freeman's favourite Swiss institutions in particular should be said to "usurp the place which ought to be occupied by English examples," when Mr. Gomme himself goes to the Jews and the Red Indians for analogies. But then he sets them in the proper sociological light, which we suppose Mr. Freeman has failed to do. When we come to Mr. Gomme's English examples, we notice one case—that of the Northumbrian Witenagemót of 627—in which the zeal of the theorist has carried him beyond his authority. He assumes that it was an open-air meeting, remarking that "The Saxons"—we pause to observe that in this case they were Angles—

did not assemble in the great city of the Romans [York]—they met outside its walls, and for a purpose which would not certainly brook the restraint of a building. No less important business was discussed there than the desertion of paganism and reception of Christianity by the people of Northumberland. The whole story is told by Bæda (*Ecc. Hist.* ii. 23): the stirring address of the Bishop Paulinus, the conversion of Eadmund [sic] the king, and the vigorous onslaught there and then made, in sight of all the assembled people, upon the sacred altars of the pagan faith by the high-priest Coef.

Now Bæda does not tell us whether the meeting was out of doors or in, or indeed where it was holden. The only distinct geographical indication is that from it Coifi rode to the temple of Godmundingaham, "non longe ab Eburaco ad Orientem, ultra amnem Doruventionem"—presumably Goodmanham, near Market Weighton. Mr. Gomme assumes that the people were assembled in sight of the temple—in which case they must have been about sixteen miles from the walls of York—but this again, Bæda does not say. Nor is it quite certain that it was a vast popular assemblage, such as Mr. Gomme conceives. Without further entering into the question debated between Mr. Freeman and Canon Stubbs as to the democratic or aristocratic constitution of the Witenagemót, we may say that this passage in Bæda on the whole makes in favour of the aristocratic theory. At any rate the *populus* is never mentioned, and it is clear that the *vulgus*, who thought that Coifi had gone mad, knew nothing of the decision arrived at by the Witan in council. In describing a later, and undoubtedly an open-air, Northumbrian Gemót—that in which Bishop Walcher was slain—Mr. Gomme lays stress upon its being held at the accustomed place, words which he italicizes. But, on turning to his authority, Roger of Wendover, we find in the corresponding passage "ad placita consueta," which is a very different thing. Had Mr. Gomme extended his researches to Florence, or to Symeon and the Durham History, or to the fourth volume of the *Norman Conquest*, where all the authorities for the scene are cited and compared, he would have learned the name of the place of meeting—Caput Capræ or Gateshead—and that the place, as well as the day—"locum et diem quo convenire"—had been fixed by previous arrangement between the Bishop and the aggrieved persons, which is rather against the notion of there being any "accustomed place." For purposes of accurate historical inquiry, it is useless to pick out "a story which Roger of Wendover relates" and to reason upon it as if it was the only existing version. In Roger's story the cause of offence given by the Bishop differs altogether from that assigned by Florence, an earlier and better authority. This Gemót at Gateshead is an important one for Mr. Gomme's purpose, because it is distinctly said—though not by Roger of Wendover—to have been held *sub divo*, although the foreign Bishop, shrinking, as well he might, from confronting the fierce Northumbrian crowd, retired with his party into the neighbouring church, at the door of which he was finally cut down. As we have in some instances criticized Mr. Gomme's treatment of his materials, we must say on the other hand that he has done good service by directing attention to the frequency and importance of open-air meetings. There is also some force in his argument that the presumption, when there is no direct evidence, is rather in favour of a meeting being held without than within doors:—

For, of course, as the folk-moot is nowhere described in any of the codes of laws, or in any of the early chronicles, the open-air meeting was not a feature to be any more specially noted and recorded, than any other primitive features which belonged to it. It was no more to these early historians or legal scribes to see a great meeting upon a plain or a hill, or by the banks of a famous stream, than it is to modern historians to see and hear of our great meetings, in Parliament and elsewhere, under the roofs of halls, specially built for the purpose.

This is well put; but Mr. Gomme rather spoils its effect by going on to prove too much. "It falls in with this general view of the case to observe that special mention is made of such a meeting as that in the upper floor of a house at Calne." The real reason why "special mention" is made of the Calne meeting is not far to seek. It was because the floor fell in, to the great hurt and damage, and in some cases to the death, of the Witan there assembled. Perhaps Mr. Gomme will say that it was a deserved judgment on them for leaving the ways of their forefathers, and the free air of heaven.

By far the most valuable part of the book is the mass of infor-

* *Primitive Folk-Moots; or, Open-air Assemblies in Britain.* By George Laurence Gomme, F.S.A., Honorary Secretary to the Folk-Lore Society, Author of "Index of Municipal Offices." London: Sampson Low & Co. 1880.

mation which the author has collected as to the procedure and customs of local, and especially of manorial, courts. There is no doubt that these obscure local institutions are the right place in which to search for survivals and traditions of the distant past. Such a tradition we come upon in the forfeiture for non-payment of the "wroth silver" due to the Duke of Buccleugh's court at Knightlow Cross—"a white bull with a red nose and ears of the same colour." This carries us back to the days when the Ohillingham wild cattle were tame. We do not wonder at hearing that "the fine has not been paid within man's memory." Much of Mr. Gomme's information is, as might be expected, and as he modestly owns, compiled from books; but as he has the great literary virtue of naming the sources of his knowledge, the reader can judge for himself what it is worth. In one case, that of the manor-court of Enborne, already mentioned, the author might have taken the trouble to refer to the authorities from which the *Spectator* derived whatever there may be of fact in its account. Mr. Spectator's correspondent, it should be remembered, took up the subject of the Enborne court, not out of interest in primitive history, but simply as a peg whereon to hang one of those elaborate jests on female frailty which never failed to tickle our forefathers. Mr. Gomme solemnly repeats as authentic history—"The steward of the Enborne manors adjourned to 'Buznabybright' [sic] that they might have a day before them"—a detail which, till it is pointed out to us in some more serious authority, we shall continue to regard as a mere joke. From the way in which Mr. Gomme speaks of "the curious custom" "as recorded in the *Spectator*," one would almost think that he really believed that "my friend, the love-casualist," had, as he professed, searched into the authentic records of the court. But it must not be thought that all Mr. Gomme's facts are of this kind. A considerable amount of information has been obtained from private and local sources; and this, of course, is more valuable than excerpts from books. Altogether, the student of early institutions will find much to interest him in *Primitive Folk-moots*, although it may fairly be described as the work rather of an antiquary and collector of historical fragments than of an historical scholar.

MEMOIRS OF THE DUKE OF SALDANHA.*

IN these two large and closely printed volumes the Count of Carnota has told everything about the life of his hero and brother-in-law which a sympathizing admirer could wish to tell, and has only omitted what was necessary to make his career and surroundings intelligible. The author is properly anxious not to swell his biography to an excessive size; but he has been very unfortunate in his suppressions. Saldanha's comings and goings, even of the most insignificant character, are told at length, but the revolutions in which his life was passed are dismissed as too tedious for telling. The brave, wise, and patriotic Marshal (we speak in the sense of the Count of Carnota) goes into exile, for instance, in 1837, after an unsuccessful attempt to "restore the Charter of 1826"; and all that the Marshal's biographer thinks proper to tell us about the attempt in question is that "It would be difficult to ascertain with certainty to whom should be ascribed the failure of the attempt at Belem." To be sure the paragraph ends with the interesting statement that Saldanha "retired from Belem disgusted with what he had witnessed." When this is taken in connexion with the fact that, in the opinion of "those in circumstances to form a correct judgment" (as nobody is named we conclude that this means the Count of Carnota), "Saldanha alone came out of the affair with honour and dignity," it is plain that some persons behaved very badly; but who they were, or what they did, the reader is left to learn from other sources. Indeed, he must find even the sources for himself, as the Count is very chary of citing authorities. This is how the biographer of the chief actor of the struggle of 1837 gives its history:—

The plans for this purpose (the restoration of the charter of 1826) were very carefully prepared, and afforded reasonable hope of success; but, through unfortunate misunderstandings on the part of some of those who held subordinate commands, the orders of the Marshals were not effectually carried out. It would be impossible to enter into the details of this struggle without extending this biography to far too great a length to satisfy the English reader. We will therefore only say with respect to the battle of Chão da Feira, at which the author was present, that the too much good faith of the Marshals Terceira and Saldanha at the moment of victory allowed that victory to slip through their hands, in consequence of the urgent request of the losing party for a cessation of hostilities in order to spare the further effusion of Portuguese blood.

Yet immediately afterwards the author can find space for a long proclamation, in the usual magniloquent Peninsular style, by Saldanha and his brother-in-arms, Luis da Silva Mousinho d'Albuquerque, setting forth their own surpassing patriotism, disinterestedness, and humanity. Had this been referred to in a note, and the gist of it given in two lines of the text, which would be amply sufficient, the space economized might have been usefully employed in giving a few explanations. But this is the course followed by the author throughout. Notes of the Marshal's to his wife and children, mostly of no interest; letters from him to the author, and letters to him from various illustrious obscure rival intriguers, are printed literally by the dozen; but, with the exception of Saldanha's own despatches to

Dom Pedro, there is scarcely a line which can be really considered as illustrating the actions of the writers. The Marshal's notes to his family are such as any affectionate father might write; but the others are merely the pompous, self-laudatory froth which everybody familiar with the politics of Spain and Portugal has heard *ad nauseam* from innumerable greedy intriguers. Meanwhile, in the Count's own narrative the events follow one another "like geese." This was the case with the author's *Life of Pombal*, in which he appeared to take for granted that his readers already possessed such an accurate knowledge of the history of Portugal as would render his own work quite superfluous to them. Two-thirds of the proclamations and letters printed, and a goodly portion of the narrative, might well have been exchanged for a coherent account of the condition of Portugal and the beliefs and aims of its people. Saldanha himself would have profited by the exchange.

The faults of the book are, we imagine, largely due to the fact that the Count of Carnota has no real interest in the historical and political aspects of his subject. He has written the *Life of Saldanha*, as he wrote the *Life of Pombal*, because he admired the men with that helpless sort of hero-worship which is content to admire their actions without trying to understand them. Towards Saldanha his feelings were those of personal friendship, which began with boyish admiration in the "cheerless month of November 1827," in Sussex Place, Regent's Park. The Count of Carnota was then Master Athelstane, and the Liberal heroes of Spain and Portugal were a very general object of admiration to boys with a healthy love of adventure. The friendship then formed continued until Saldanha's death. In 1856 the author and his hero became connected by marriage. Saldanha had lost his first wife, a Miss Hogan, and being determined to marry again, came to England to propose to Mrs. Binns, a widowed sister of the author's. The Duke did not leave Portugal unconditionally resolved on this bold step. When asking the King's permission to travel and to marry, as the Portuguese law requires the nobles to do, he informed Dom Pedro that he should only marry the lady if she were not so changed as to be "found wearing a wig." We have the Count of Carnota's word for it that this announcement caused "the stern Dom Pedro," who had never been seen to laugh, to writhe with laughter. We wonder what the Duke's heirs did when they read it in print. Fortunately, as the author says, "There was no wig to mar their happiness!" and Mrs. Binns became Duchess of Saldanha. There are a great many personal details of this nature scattered about the book, and mixed with them much profound moral reflection of the kind which consists in pointing out that everything would have been settled much more nicely if all parties concerned had been better men.

The true interest which attaches to the career of the Duke of Saldanha was admirably put by Lafayette in a letter addressed to him in 1833. He says, "Votre affaire portugaise est devenue européenne. C'est un commencement du cinquième acte, qui j'espère terminera la tragédie de '89, au profit de la liberté de cette partie du monde." During the latter years of Ferdinand VII. of Spain, and before the necessity of finding some support for his daughter Isabel had induced him to seek reconciliation with the Liberals, the friends of constitutional liberty in the Peninsula were compelled to fight their battles in Portugal. In both countries the real cause of dispute was the determination of a minority of the people, mostly inhabitants of the towns, to secure better government than they could hope for from the old absolute monarchy, supported as it was by the Church and the rural population. These latter, again, supported the absolute King because any attack on the Church or on their rooted habits roused them at once to armed opposition. Don Carlos or Dom Miguel, on one side, and the various Constitutions on the other, were simply pretexts. Constitutional government has seldom been taken seriously in the Peninsula. There can be little doubt that, had either Ferdinand VII. or Dom Miguel been able men capable of governing well, they might have ruled with absolute power, supported by the steady loyalty of their subjects, to the day of their death. Perhaps fortunately, their rule was of a kind which would not have been tolerated at any period of their country's history, and Ferdinand was compelled by interests of his own to seek the alliance of the Liberals. The latter became also the pets of the more aggressive Liberal parties outside of their own country, and were patronized (with a strict regard for his own interests) by Louis Philippe, and by the restless activity of Lord Palmerston. Whatever interest Saldanha's career may have beyond his own country is due to the part he played in that struggle.

Without going all the length of the Count of Carnota's admiration, which is far beyond the utmost allowed to biographers, it is only just to acknowledge that that part was honourable. Saldanha was by no means indifferent to his own interest, but he had also a sincere regard for the interests of his country, and when the two directly clashed he was capable of sacrificing his own. He was at any rate conspicuously above the ordinary low level of Spanish or Portuguese public men. His abilities as a soldier appear to have been respectable. The Count habitually writes about him as if he had been a Napoleon, and in one passage he establishes a perfectly ridiculous comparison between his operations against the Miguelites in Santarém and Wellington's campaign against Massena over the same ground. The same tone is maintained throughout. In giving an account of the siege of Oporto, in 1833, the author indulges in a great deal of somewhat puerile satire against Solignac, the French general first placed in command by

* *Memoirs of Field-Marshal the Duke de Saldanha; with Selections from his Correspondence.* By the Conde de Carnota, Author of "Life of Marquis of Pombal." London: John Murray. 1880.

the Liberals, who was guilty of the unpardonable offence of standing in Saldanha's way. His failure to raise the siege and his final retirement are exulted over with much glee. Colonel Badcock (of the 7th Hussars), who was present as agent of the English Government, very sensibly attributes the French general's failure to the fact that the Portuguese habitually disobeyed his orders and caballed against him. Saldanha, who succeeded him, showed both energy and personal courage; but it is plain from Colonel Badcock's narrative that he owed as much to good fortune as to merit. According to that officer, a Peninsular veteran, the Miguelite generals committed "every sort of blunder," and actions swollen into great battles by our author and the judiciously vague despatches of Saldanha shrink in his sceptical narrative into mere skirmishes. Yet, if Saldanha was not a great general, he was not improbably as good as Bourmont, the French chief of the Miguelites (who was doubtless hampered by intrigue as Solignac had been), and certainly better than any of his Portuguese rivals. The great service he did his party was to supply it with a native leader of sufficient energy and ability to end the war by a complete surrender of the enemy, and not such a compromise as the Convention of Vergara. He thoroughly appreciated the fighting powers of those ragged foreign (mostly British) adventurers, the Oporto grenadiers, "who fought and were flogged, and were not paid," and he trusted them to bring him off safe when, as for instance, at Almoester, his tactics were at fault. As a politician, Saldanha habitually supported the Charter of 1826, a moderate compromise which left the central Government strong enough to suppress mere anarchy. Although he was probably not spotless, he was doubtless as sincere in his principles as any of his contemporaries. What the realities of his political career were, it is impossible to learn from this life, and it may be safely asserted that Saldanha took good care that it always should be impossible. The Count of Carnota seems to consider his own unsupported assertion sufficient, and indeed his book contains abundant proof that he was never trusted with the real secret of what was going forward. We conceive we pay him a compliment in saying so.

In one respect Saldanha differed very widely from contemporary Spanish generals and politicians. He was by birth and education a gentleman. On his mother's side he was a grandson of Pombal and descended from the Austrian house of Daun. His father's family was, like those of most of the Portuguese nobility, a branch of an ancient Castilian house, and was besides connected by marriage with the Rohan-Chabots. Saldanha received a good education in one of the schools established by Pombal, and attained in particular to a thorough knowledge of English, which he wrote well. His despatches, especially those written to persuade Dom Pedro to come from Brazil and put himself at the head of the Liberal party in Portugal, are clear and able. His biographer informs us that in his boyhood Saldanha took Sir Charles Grandison for his model, and he seems to think that he acted up to it. The Marshal was not quite so immaculate a hero as that; but he can still be respected, and, if compared with the average Spanish or Portuguese politician, may be highly respected. In private life he was apparently kindly and considerate of others.

TWO NOVELS.*

THE first of these two stories is of considerable merit, and will well repay the trouble of reading. Of the second we shall have something to say presently. Mr. Caroli is the son of a Genoese sea-captain, who in the course of his voyages comes to London and falls in love with the sister of a merchant with whom he has dealings. The brother views the match with the antipathy of a thick-headed domineering man, fond in his way of his sister, and suspicious of the iniquities which he supposes to be concealed under the imposing presence and attractive manners of the foreign suitor. The lover, however, after standing the test of a year's absence and of the most searching inquiries, succeeds in marrying the girl, and takes her away with him to his own country. Mr. Caroli, the hero of the book, is born at Genoa, and educated during his earlier years at Venice. He is thence, at the time when the independence of Venice was threatened and afterwards destroyed by Napoleon, transferred to London. The boy's life in London, where he grows up, and his warfare with his unsympathetic English relatives, are described with a good deal of cleverness and humour. One of his chief enemies is a certain Miss Potts—a "family connection" who, after the death of his uncle's wife, undertakes the management of the household. She is a sour, vindictive old maid, the terror of children, whose portrait is capitally drawn. To this home the mother and child return, while the father continues his seafaring pursuits. He is soon lost sight of, having been captured, as appears later on, by the Algerian corsairs, who at that time followed their trade with comparative impunity; and his wife and two children are left to the tender mercies of their English relations. As year after year goes by without any news being heard of the father, the strangers sink more and more into the position of poor relations, and have to undergo all the indignities and humiliations which such a position is apt to carry with it. The sister dies early, and

the boy, after a couple of years' schooling, is put to a trade. His early friendships are described with much grace and feeling, especially his relations with a family of French emigrants named Dufour. Just as his relations with his own kindred are fast becoming intolerable, he is saved by the appearance of a Genoese uncle, with whom he and his mother start on their return to Italy. The voyage is marked by two events of importance. First, Mr. Caroli, then a young man of twenty years of age, falls in love with Angela Rocco, the daughter of the captain of the vessel; and secondly, all his hopes are cut short by the capture of the ship by Barbary pirates. The second volume and the greater part of the third are taken up with a description of slave life in Algiers. The subject has the advantage of novelty, and is treated with a picturesque liveliness, and at the same time with a freedom from all sensational effect, not often to be met with in recent novels. But there is undoubtedly too much of it, or rather of the reflections and dissertations which are mixed up with it. Mr. Caroli succeeds, by his own labours and by the interest of friends, in ransoming Angela at the end of a considerable time, but has himself to wait for his release till the famous bombardment by Lord Exmouth put a final end to European slavery in Algiers. He comes back to England to find Angela married to his cousin and boyish enemy Augustus Maitland, and to console himself at last in the love of Antoinette Dufour, his early friend and playmate.

There is much in this book that is attractive and interesting. It is pleasant to read, and leaves a pleasant impression behind. Its moral tone is blameless; and, indeed, if we wanted to find fault, we should say that it contains rather too many obvious and threadbare reflections on moral and religious themes. The sketches of childish life and character at the beginning are excellent. The development of character and of the story as the hero grows up is less successful; and the hurried and huddled style of the conclusion, where fifty pages describe a number of the most decisive events of the hero's life, cause one to regret the length to which the Algerian part of the narrative had been extended. Had we been spared some of the moralizing in that part of the book, not only would more space have been left at the end for a fuller development of the plot, but the Algerian experiences would have formed a picturesque series which could be read without "skipping" or effort of the attention.

We wish we could say as much in favour of *Dr. Victoria*. It is just one of the books which are an affliction to the reviewer. There are a great many novels which, without being conspicuously silly or objectionable from a moral point of view, are so flat and empty, so destitute of point or of any reason to exist, that it becomes a problem not only who reads them, but who could possibly take the trouble and undergo the manual labour of writing them. The mass of good books now existing is so great, and the time to read and digest them so short, that a bad book or an inane book ought to be pointed out as a public nuisance. In some respects a simply inane book is even more of a nuisance than a positively bad one. For out of a bad one there is often some amusement to be got. It is easy to say that nobody is bound to read a book which he does not like. But so nobody is bound to buy an article that he does not like in the market. It is not the less true that it is a bad thing to have the market glutted with worthless or spurious articles. They diminish the chances of those people who do good work, and they tend still further to lower the taste of the idle and half-educated persons of all classes to whom only such books appeal. There is, however, one point on which something is to be learned and some amusement to be got from this otherwise uninteresting and unentertaining narrative. Let the reader go through it, and correct the bad French with which it is plentifully sprinkled, and he will have sharpened his recollection, if it is rusty, of the elements of French grammar, while he will have derived some amused astonishment from the question why a writer should deal so freely with a language of which he has still the simplest rules to learn. We read of a *mauvaise quart d'heure*, of *avec mille amitiés*, of *Que tu es heureux* addressed to a woman, of *Ah, c'est honteux*, and so forth. We find Italian like *pappalini* for *papalini*; *Si, Signor, e vero* for *Si, Signore, è vero*; *Vittorio Emanuele* for *Vittorio Emanuele*. We have in German *Brautigam* for *Bräutigam*, and we have a word like *figurantes*, which belongs to no one known tongue, though it may be a compound of two. To quote the author's own words, "Let fools scoff as they will, knowledge is a power"; and we might suggest that a slight knowledge of the languages one writes in or quotes from may serve as a shield and buckler against the mockery of the irreverent reader. As to his own language, the author escapes from many of the difficulties which beset composition in it by adopting what may be termed the interjectional style, of which the following is a specimen:—

Not an hour, not a minute, not a moment, in which she could call herself free. Yet every hour, every minute, every moment dedicated to herself. Inventing new combination of colours for this dress and that; shopping; sitting for her portraits in many styles; riding in the park, driving in the park; morning calls; daily services in fashionable churches; morning concerts and daily kettledrums; dinners, dances, theatres, drawing-rooms—all following each other unceasingly, unendlessly. Moving from one point of vantage to another. Admiration, here, admiration there. Somewhat of satiety at last. Something else to seek for. Something more lasting, more real—for the reign of the belle of the season cannot last; the worshippers of beauty need change. It is for this season. But for the next—who can tell?

So much for the style, native and foreign, of this book. The story runs as follows. It opens with an unpleasant death-bed scene, in which a betrayed and forsaken girl leaves behind her, to the care of an aunt, the child who afterwards turns out the hero's

* *Mr. Caroli: an Autobiography*. Edited by L. G. Segula. London: Sampson Low, Marston, Searle, & Rivington. 1881.

Dr. Victoria. By Major-General Alexander, C.B. London: Tinsley & Co. 1881.

of the tale. To summarise her story, she studies medicine and marries nobody. She is wooed by one of the heroes, Sir Francis Hawthorne, "a dark, sunburnt young man, with an air of quiet determination which showed itself in everything he said or did, and would have caused him to be recognized in any part of the world as an Englishman." The author's patriotism seems here to lead him to take too unfavourable a view of the other nations of the earth, among whom we can recall several persons of our acquaintance who are not without this "air of quiet determination." Yet his frequent quotations from other tongues indicate that it is in no spirit of blind hostility, but rather "in spite of all temptations to belong to other nations," that he claims for us a monopoly of this imposing personal quality. Victoria accepts Sir Francis, but hardly has she done so when she attains the age of nineteen, and the secret of her birth is then, according to the wishes of the aunt, revealed to her in a document handed her by a certain Dr. Pringle, who acts as a sort of guardian to her; whereupon she breaks off the match, and sets to work for her profession. Victoria is closely united with the Yorke family, the two daughters of which, Geraldine and Eva, are bosom friends of hers. Geraldine marries a duke whom she does not care for, and it is of her that the interjectional passage quoted above is written. Sir Francis, failing in love, tries to get into Parliament, and fails in this also. Victoria goes to Zürich to study, and Sir Francis to Italy to improve himself in other ways. Of the really interesting student life in Zürich, which would have fitted in admirably at this part of the story, the writer gives us, whether from ignorance of it or not, no picture at all. Sir Francis betakes himself to Rome, but what he does there it is hard to make out. He certainly moralizes a little, and does so after this fashion:—"Rome! that city in which the Past looms out of the dimness of time in proportions which dwarf the Present, stand out as the Present may in all the gloss and glitter of its modish garb!" with more of a like sort. He bewails at much length, and in a similar strain, the evils which superstition has inflicted on the human race. "The Rome of tourists and guide-books"—in other words, all the treasures of painting and sculpture which are to be found in Rome—Sir Francis did not "care to see"; neither does he care to see the Pope and our good friends the "pappini." So he leaves Rome and moralizes again on the bad cultivation of the Campagna. Surely if this rising young politician was above seeing the Vatican because "tourists" go there too, he might not have been above studying the social and political life of modern Italy, and might have returned to England a trifle fuller of knowledge and a trifle less devoted to aphoristic wisdom. In Florence, however, his taste for art awakes or revives. "His days were spent in her galleries, in her churches, and he marvelled at the genius, the patience, the life-long assiduity, which had left such a lasting record of loving labour." He objects, however, to putting pictures together in large numbers, and thinks that the artists would be grieved at finding so many people looking at them. The churches please him less still, because of the candles which stand on the altars and hinder the spectator from seeing them properly. A trifle given to the *custode*, if only Sir Francis had known it, would have caused every candle to vanish with marvellous speed. Instead of offering this, however, Sir Francis moralizes yet again, this time on the end of art. "To what extent had art performed its mission as a teacher?" But here we must give up the attempt to follow out the subtle workings of Sir Francis's logic. "Man," he says, "has no innate idea of beauty." "The answer came," we read, "but Sir Francis was not satisfied with it." "What!" he again asks, "is this true?" And so, finding no solution of his doubts, he begins to moralize once more. The rest may be told in a few words. Sir Francis joins the Alpine Club, gets into Parliament, and, let it be hoped, leaves off the practice of the *sage Mambres* of Voltaire, *qui faisait toujours des réflexions*. Victoria turns out to be the daughter of Mr. Yorke and sister of Geraldine. She also turns out an excellent oculist, and performs a skilful operation by which sight is given to a blind girl. Sir Francis marries Geraldine after all, her husband having opportunely betaken himself to another world; and the minor characters of the book mostly turn out well and end happily. The author delivers himself shortly before he concludes of an oracular utterance, with which we, too, will draw to a conclusion:—"This book is not intended to be 'realistic,' in the modern sense of the word; if it were, we should ask the reader to put it into the fire at once." We do not know what is the distinction between "realistic," in the ancient and modern sense of the word, as applied to novels, nor do we in any case suggest to the reader that he should treat the book so impolitely; he will do better to leave it uncut.

GERMAN LITERATURE.

THE Albanians (1), having contributed their mite to the general embroilment of the Eastern question, have fairly earned the privilege of having a Special Correspondent among them to make Europe understand, if possible, who they are and what they want. The peculiarity of their language renders intercourse with them no easy matter, and the advantages enjoyed by Herr Spiridon Gopčević in this respect, and from his general

familiarity with the affairs of the Balkan peninsula, are more than a compensation for his strong political preconceptions and a flip-pant style of writing more becoming a representative of the press than an ethnographer and historian. In the former capacity Herr Gopčević writes very amusingly; but has not much to describe, except landscape scenery and his own sufferings from vermin, bad coffee, and the lack of small change. The really valuable portions of his work are his elucidation of the obscurities of Albanian ethnology and history, and his sketch of the manners of the people. The Albanians are, he thinks, the representatives of the ancient Pelasgian population of the Greek and Italian peninsulas—a theory for which he himself assigns no conclusive evidence, but which may be deemed to be countenanced by the curious fact that the only vestige of the old Messapian language originally spoken on the opposite coast of the Adriatic is an Albanian word. The name by which the people call themselves, Skipetar (rock-people), in itself condenses the history of a race driven from the plains and maintaining its independence in the most inaccessible districts. There, however, the Albanians have not merely entrenched, but extended, themselves; for Herr Gopčević shows by the evidence of local names that the northern districts of Albania must have been occupied by Servians in the mediæval period. At present the people are divided into two chief tribes—the Gëgi of the north and the Toski of the south—whose dialects differ as widely as High and Low German. It is quite in keeping with the general history and character of the country that the mountaineers should be generally Christians, while Mohammedanism prevails in the more level districts. The most important Christian tribes are the Mallisori and the Miredita, both virtually independent of the Porte. It is scarcely to be expected that independence of all foreign control can be long maintained, and, according to Herr Gopčević, the country is even now the theatre of an underhand struggle between Austria and Italy. Much perturbation, he says, was recently occasioned among the Austrian authorities by the discovery that the Italian Franciscans, upon whom they had relied as political emissaries, were secretly agitating on behalf of their own country. The influence of the Catholic clergy upon the Christian population is very great, and, as it is used rather to discourage than to promote education and civilization, the condition of their people in these respects, equally with that of the Mohammedans, is very low. It must be borne in mind, however, that Herr Gopčević who is probably a Servian, has no affection either for Austrians or Catholics, and his dislike for both is continually breaking out. On the whole, it seems difficult to anticipate any satisfactory destiny for this interesting people, and it is much to be regretted that ecclesiastical differences should, to all appearance, estrange them completely from the Greek kingdom, to which they naturally belong, and to whose population they would contribute a very valuable element.

The interest of a publication which we may safely attribute to Herr Julius Eckardt, "Nicholas I. to Alexander III." (2), is somewhat diminished by the greater part, if not the whole, of the contents having already appeared in periodicals, and by its consisting of a series of detached papers, which, however attractive in themselves, afford no comprehensive view of the period of transition through which the Russian Empire has been passing. They cast, nevertheless, numerous side-lights upon some interesting though minor phases of this great historical drama. Their especial value, perhaps, consists in the number of private official reports of which the author has contrived to obtain copies, which bear every internal evidence of genuineness, and which, having been originally published in the *Rundschau*, would have been already contested if there were any room for controversy. Among these are two elaborate memoirs on the foreign relations of Russia in the years 1864 and 1869, remarkable for the frankness with which other Powers are spoken of, and involuntarily suggesting the conclusion that Russia's interests are so adverse to those of all other European States that durable alliances are impossible for her. Another memorandum relates to the Polish insurrection; another secret document, and an exceedingly curious one, is a withering rebuke addressed by Marshal Paskewitch to Prince Gortschakoff for his mismanagement of the Crimean campaign. Paskewitch takes the greatest blame to himself for having dissuaded the Emperor from dismissing Gortschakoff, to whom he imputes disasters which were evidently felt as extremely severe at the time, whatever attempts may since have been made to extenuate them. "The Russian Emigration in London from 1852 to 1864" is an entertaining account of the relations of Alexander Herzen with Kossuth, Ledru-Rollin, Bakunin, and other leading exiles. These seem to have been, for the most part, anything but brotherly. A postscript to the work declares revolution in Russia to be inevitable, but intimates that there is yet time to prescribe and control its course. Parliamentary institutions are pronounced wholly unsuited to the country.

Herr Geffcken's political history of the Crimean war (3) is made up of a series of separate studies, some of which have already appeared in periodicals. It is chiefly intended to present the subject in the new light thrown upon it by such important recent publications as the diplomatic memoirs of Baron Jomini and the French history by M. Rousset; the Life of the Prince Consort is

(1) *Oberalbanien und seine Liga*. Ethnographisch-politisch-historisch geschildert von Spiridon Gopčević. Leipzig: Duncker & Humblot. London: Williams & Norgate.

(2) *Von Nicolaus I. zu Alexander III. St. Petersburger Beiträge zur neuesten Russischen Geschichte*. Leipzig: Duncker and Humblot. London: Kolckmann.

(3) *Zur Geschichte des orientalischen Krieges, 1853-1856*. Von F. H. Geffcken. Berlin: Paetel. London: Williams & Norgate.

also laid freely under contribution. The author's criticism is remarkably judicious and impartial. He fully admits the abnegation of international duties by Austria and Prussia during the contest, and the pernicious consequences of this apparently crafty policy for the former State; he also recognizes the substantial advantages gained by England, notwithstanding her numerous deceptions and mortifications, while pointing out how these were again sacrificed by the weakness of English policy at Constantinople since Lord Stratford de Redcliffe's time. Lord Beaconsfield is blamed for having lacked the courage to act upon his own sound judgment, and stop the late war at the commencement, as he afterwards acknowledged he could have done. History will ratify the censure, but chronology will not bear Herr Geffcken out in asserting that the Congress of Berlin was influenced by the Russian mission to Candahar. For the future Herr Geffcken looks confidently to the alliance of Austria and Prussia as a bulwark against further Slavonic aggression, and predicts that it will ere long be joined by England.

The history of the Margraves of Meissen (4) is, no doubt, of considerable local interest, but presents nothing attractive to general readers except the light incidentally thrown upon the Germanization of the Slavonic tribes, which, at the time of the Teutonic conquest, inhabited the district between the Saale and the Oder. The process appears to have been very gradual; and, after the complete subjugation of the country, very peaceful, being effected chiefly by missionaries, and the general superiority of civilization over barbarism. One possibly unwelcome corollary seems to result from Herr Posse's data, that the eastern half of Germany must be deeply leavened with Slavonic blood.

Herr Carl Frey (5) treats of an important and curious chapter in German history—the alienations of the Imperial domain under Philip, King of the Romans, at the beginning of the thirteenth century. Philip appears to have been driven to this course by absolute necessity, and his policy was justified by success so far as he was personally concerned, but the diminution of the sovereign's private resources greatly contributed to bring about the long paralysis of the central authority in Germany. Another curious question, the relation of the kingdom of Arles to the German Empire, is the subject of an essay by Dr. R. Sternfeld (6).

Dove's miniature biographies of the Forsters, father and son, and the brothers Humboldt (7), are reprints from that exceedingly valuable work, the *Allgemeine Deutsche Biographie*. The lives of the Forsters, although perfectly adequate as contributions to a biographical dictionary, hardly merit reprinting; and Herr Dove is less at home with Wilhelm von Humboldt than with his more celebrated, but perhaps not really more eminent, brother. His account of the latter is very good, duly appreciative, but impartial, and, like the other articles, free from the patriotic exaggeration which might have been expected and excused in a dictionary of national celebrities.

The minor writings of Wilhelm Grimm (8) form an acceptable counterpart to the similar collection of the miscellaneous remains of his more celebrated brother Jacob. So far as indicated by the first volume, they consist principally of studies in early German literature and folk-lore, including some reviews of works by Achim von Arnim and other members of the Romantic school. By far the most extensive is an essay on the origin of German poetry, first published in 1808. The volume is prefaced by a short autobiography, written in 1831, and highly characteristic of the simplicity, candour, and unpretending desert of the writer.

The Codex Wirzburgensis, the most important of the Irish MSS., edited by Herr Zimmer (9), contains a very copious gloss, partly Latin and partly Irish, upon the Epistles of St. Paul. It is rather an abridged commentary than a mere glossary, and is of considerable philological, though of no other, value. The date is probably the ninth century. Herr Zimmer has added a number of other fragments from various MSS., including some very curious incantations, and has accompanied the collection with an elaborate preface.

Dr. Steinthal's (10) standard work on the science of language appears in a new edition, with improvements. The first part, which is all at present published, is devoted to the general theory of language, and strives to elucidate the problem of its origin by research into the psychological aspects of the phenomenon. It is very ingenious, but chiefly serves to establish how very short a way such research will take us, and how essential in every investigation are the actual observation and experiment which are unfortunately impracticable in this.

Peter Martyr's letters (11) are well known as a valuable source for contemporary history, especially the history of Spain and Italy, at the end of the fourteenth and the beginning of the fifteenth century. In some instances, however, Martyr's prognostications display so much of the spirit of prophecy as to justify a suspicion that they have been interpolated, or at least revised after the event. Dr. Heidenheimer, the author of an interesting and useful monograph upon this body of correspondence, seems to think there can be little doubt on the subject. Enough of undoubted genuineness nevertheless remains to render the collection exceedingly valuable, and Dr. Heidenheimer satisfactorily proves its general trustworthiness by its undesignated coincidences with other sources. He has further done much to recommend it to the reader by an analysis of Martyr's most important references to public affairs, and a list of the most remarkable persons to whom his letters are addressed or who are mentioned in them, as well as a biographical introduction and a sketch of Martyr's performances as a diplomatist and writer on geography. One of the most curious points in Martyr's writings is their testimony to the penury of Spain, even at the time of her greatest influence upon European affairs, and the general aversion of her people to commercial or industrial pursuits.

The German Society for the Relief of Shipwrecked Persons has published (12), in aid of its funds, an album of facsimile autographs and drawings by eminent contemporaries, from the Emperor downwards, although Prince Bismarck does not seem to have contributed. Some of the autographs are of considerable length, and possess much interest for those able to decipher German handwriting.

The centenary of Voss's translation of the *Odyssey* (13) is appropriately celebrated by a republication of this noble work in its original form, the alterations which it has since undergone not being invariably regarded as improvements. Herr Bernays, the editor, has prefixed a long and interesting preface on the history of the work and of Homer's translation in Germany before the time of Voss. The Germans seem to have been very slow to discover the peculiar adaptation of their language for the reproduction of the Homeric hexameter and the Homeric compound epithets. Bodmer, the Swiss translator of Milton, first showed that it was feasible; but long after Bodmer no less a poet than Bürger was still trying heroic blank verse—a metre which German poets have never learned to write. Stolberg responded with a practical demonstration of the superiority of the hexameter; and, while Bürger and Stolberg were contending for the crown, Voss stepped forward and carried it off.

"Sword and Pen" (14), by Count Adelmann, is a pretty story, rather sentimental, but not deficient in power. The military scenes are particularly lifelike, and the trouble in which the hero involves himself by writing a pamphlet is characteristic of the present state of affairs in Germany. The preface is sensible and patriotic.

It took twenty-one years for the First Part of *Faust* (15) to make its way to the stage as a complete tragedy, although specimens and adaptations had been presented some years before, one in England. Klingemann, whose own version of the legend is so unmercifully ridiculed by Carlyle, was the manager on the first actual representation, and was presented by Goethe with an amethyst ring, whose genuineness is much questioned by the *cognoscenti*. The first part is now fully recognized as a stock piece. The Second Part is still struggling to establish itself, and will, Herr Orizenach thinks, scarcely obtain more than a *succès d'estime*.

Goethe's pretty little operatic trifle, *Jeri und Bätely* (16), is printed for the first time in its original form, from a MS. in the ducal library at Gotha.

The "Hungarian Review" (17), published under the patronage of the Hungarian Academy of Sciences, is a continuation and extension of the "Literary Reports from Hungary," addressed more directly to the general European public. The first number contains several articles of considerable importance, among which a reassuring view of the mutual relations of the Germans and the Magyars is the most important, and the sketch of Galeotti Marzio, an Italian scholar and adventurer, who found his way to Hungary in the latter part of the fifteenth century, the most entertaining.

This month's number of the *Rundschau* (18) is very good. The contribution of most importance is perhaps a secret memorandum, addressed to the Russian Government, on the progress of Nihilism in 1873, which, early as the date is, refutes the notion that

Nihilism is the creation of a mere knot of desperadoes. It rather appears the result of general dissatisfaction, accumulating dangerous elements for which no safety-valve has been provided. Another very interesting paper is Count Scher Thosz's reminiscences of the Hungarian insurrection of 1848. The Count served under G6rgey, for whom he has an enthusiastic admiration, and whose surrender to the Russians certainly seems less extraordinary when we hear of the contemptuous feeling of the latter towards their Austrian allies. G6rgey, it appears, had actually offered the crown of Hungary to the Duke de Leuchtenberg, but the overture led to nothing. Count Thosz is a plain, straightforward soldier, and ignores the political jealousy and envy which are usually supposed to have influenced his general's conduct. Dr. Brandes writes a very fair analysis of Gustave Flaubert; the Prussian officer's journal of the events of 1848 is continued, and an article on Tunis contributes something to the comprehension of the situation. The writer considers that the financial embarrassments of the Bey necessitated European intervention in some form. The State, it appears, was on the verge of bankruptcy some years ago. Khairaddin Pasha rescued it for a time; but since his disgrace the old condition of affairs has returned.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 58 gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

The SATURDAY REVIEW is duly registered for transmission abroad.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsagent in Town or Country on application to the Publisher.

THE SATURDAY REVIEW

OF
POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,328, JUNE 18, 1881:

The Land Bill.	Eastern Affairs.	The Tenure of Land.
The Senate and M. Gambetta.	Local Option.	America. Surrey Commons.
The Dissolution of the German Parliament.		Vaccination and Small-Pox.
Dulwich College.	Skirmishing at Liverpool.	
Destruction of the City Churches.	The Curiosities of Criticism.	
The Metropolitan Police Force.	The Bank of France.	Sculpture in 1881.
	The Operas.	The Theatres.
The Correspondence of Talleyrand.	Australian Aborigines.	
Two Pretty Girls.	New Colorado.	Oldfield's Nipal.
Gomme's Primitive Folk-Moots.	Memoirs of the Duke of Saldanha.	
Two Novels.	German Literature.	

CONTENTS OF No. 1,327, JUNE 11, 1881:

The Land Bill—The Transvaal—Kings and Princes of the Danube—The Indemnity to American Fishermen—Lord Derby on Co-operation—The Spoils of the Turks—Industrial Schools—Russia—The Senate and the Scrutins.

A Squire's Note-Book in the Seventeenth Century—Past and Present—Mr. Froude on the Tractarian Movement—Cricket—Litt6—George Stephenson—Steam-Yacht Racing—Trade Prospects—The Picture Galleries. V.—The Oaks.

Ancient Bronzes—The Metropolitan Area—Ayala's Angel—Gordon's Central Africa—Holmes on the Common Law—Recent Verse—New Text-Books of Science—David Broome, Artist—in the Ardennes—Minor Notices.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

DORR'S GREAT WORKS, "CHRIST LEAVING THE TOMB," "CHRIST ENTERING JERUSALEM," and "MORNS BEFORE PHARAOH," each 25 by 25 feet; with "Dream of Peter's Wife," "Christian Martyrs," &c. at the DORR GALLERY, 25 New Bond Street. Daily, Ten to Six. 1s.

THE GROSVENOR GALLERY.

SUMMER EXHIBITION.

Now Open daily, Nine to Seven.

Admission, One Shilling. Season Tickets, Five Shillings.

AYVASOVSKY EXHIBITION.—"COLUMBUS'S SHIP IN A STORM," "COLUMBUS LANDING ON SAN SALVADOR," and many other interesting works by AYVASOVSKY, the greatest of Russian Artists. Now on View at the FALL MALL GALLERY, 46 Fall Mall. Admission, 1s., from Ten until six.

OWENS COLLEGE, MANCHESTER.—Under a recent Resolution the Council propose to appoint to FIVE FELLOWSHIPS in SCIENCE or LITERATURE, each of the value of £100, tenable for one year, but renewable for two years further. The Appointment will be made not on the results of Examination, but after consideration of documentary or other evidence. Every holder of a Fellowship will be expected to devote his time to the prosecution of some special study approved by the Council. Further particulars may be obtained on application to the PRINCIPAL. Candidates must send in their applications, in writing, on or before the 1st October next. J. HOLME NICHOLSON, Registrar.

SOMERSETSHIRE COLLEGE, BATH.—An EXAMINATION will be held on July 13 and 14, to elect to SEVEN ENTRANCE SCHOLARSHIPS.—Particulars may be obtained from the HEAD-MASTER.

ROSSALL SCHOOL, ENTRANCE SCHOLARSHIPS.—Twelve to be competed for, June 28. Value from 70 Guineas (covering School Fees) to £20. Ages under 14 and 15. Candidates may be examined at Rossall or Oxford, as preferred, in Classics or Mathematics.—Apply to Rev. the HEAD-MASTER, Rossall School, Fleetwood.

HIGHGATE SCHOOL.—Sir R. CHOLMELEY'S FOUNDATION, 1825.—SIX SCHOLARSHIPS, £24 per annum, open to Competition in July.—Further particulars on application to the Rev. the HEAD-MASTER, School House, Highgate, N.

SIR A. JUDD'S SCHOOL, TONBRIDGE.—Examination 20th September next.—SIX SCHOLARSHIPS, consisting of exemption from tuition fees, for two BOYS and five GIRLS, Two under Fifteen, Two under Fourteen. For one of the two under Fifteen an Exhibition of £40. Also THREE HOUSE SCHOLARSHIPS.—Apply to Rev. T. B. ROWE, M.A., Head-Master, Tonbridge.

PREPARATORY EDUCATION.—TWO SCHOLARSHIPS of 30 Guineas per annum, in a First-class SCHOOL on the South Coast, will be given in July to BOYS under Eleven, who are intended for one of the Public Schools. Preference will be given to the Sons of Clergymen, and easy Examination Papers will be sent to the homes of applicants.—Address, CLEMENTS, care of Messrs. Askin, Gabbins, and Kilik, 24 Beakville Street, London, W.

MALVERN COLLEGE.—The NEXT TERM commences Tuesday, September 27. For particulars, apply to HENRY ALDRICH, Esq., Secretary.

TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.—The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and all competitive Examinations. Exhibition to the Universities of £10 per annum. Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms 50 and 60 Guineas.—Apply to the WARDEN.

ST. EDMUND'S COLLEGE, SALISBURY.—A HIGH-CLASS SCHOOL for SONS of GENTLEMEN. The religious training is upon definite Church principles. Boys are Educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, £75 a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.C.L.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

CAREFUL PREPARATION for the PUBLIC SCHOOLS, with good Church training. Ten years' experience. Large house and grounds, cricket-field, and all carpenter's room, &c.—Address, Rev. HENRIET MOORE, M.A., Allen House, Guildford.

UNIVERSITIES, ARMY, PUBLIC SCHOOLS.—A Derbyshire CLERGYMAN, M.A. Oxon., formerly Assistant Classical Master in the Charter-house, and for several years a Pass Tutor in Oxford, receives a few PUPILS for the above Examinations. Terms, for boys over Sixteen, £150; under Sixteen, £120.—Address, M.A., the Rectory, Marston Montgomery, Derby.

DAVOS.—Mr. J. W. LORD, M.A., Fellow of Trinity College, Cambridge, is desirous of taking a limited number of PUPILS to prepare for entrance at the Universities, Entrance Mathematical Scholarships, or other Examinations. The climate of Davos is particularly beneficial in cases where bracing and strengthening are needed before entering on harder work. Terms £150.—For further particulars, address Wadgate House, Walton, near Ipswich.

EDUCATION.—GERMANY, BONN—on-the-Rhine, 37 Baum-schuler Allee.—The Fräulein KUNDE receive a limited number of YOUNG LADIES. Home comforts, best masters, unexceptionable references.—For particulars apply to the above.

A. B. A. (Honours), of Trin. Coll., Camb. Public School man, accustomed to travel, wishes to READ and TRAVEL for some period between the middle of August and the middle of October, with a BOY home for the holidays, or about to go up to the University.—Address, T. S. L. May's Advertising Offices, 159 Piccadilly.

A GENTLEMAN desires OCCUPATION anywhere with a modern and noble-thinking men who aim at promotion of human progress as much as at money. Aged Forty. Slightly nervous (hypochondriacal vasomotoric). Has been physician; has given up; cannot work hard; cannot bear heavy sky.—Understands languages, but not music; no calligraphy; no drawing.—Address, NICO OTTOM, Esq. & Jones, Advertising Office, Spring Gardens, S.W.

READY to RETURN to INDIA next Southampton Mail.—**AYAH** (Portuguese) Good sailor.—Apply, until Sunday night, 210 Cornwall Road, W.; afterwards, Mrs. MARTIN WOOD, Oakhill Road, Sheffield.

WIMBLEDON PARK ESTATE.—FREEHOLD BUILDING LAND for SALE. In large or small Plots, according to situation. Free Conveyances, Roads and Sewers made, 750 acres remaining to select from.—Apply to the Resident Agent, Mr. ALFRED W. OSBORN, Surveyor, Wimbledon Park.

METROPOLITAN HOSPITAL SUNDAY FUND. Patron—Her Majesty the QUEEN.

HOSPITAL SUNDAY, June 19, 1881. Cheques crossed Bank of England, and Post Office Orders, made payable to the Secretary, Mr. HENRY N. CUSTANCE, should be sent to the Mansion House.

BLACK COB TO BE SOLD.—This Stallion, Fourteen hands, is quite sound, and quiet to ride. Three years. Highly recommended.—Apply to HENRY ELWELL, Harlow, Essex.

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel. BENJN. BULL, Manager.

THE ILFRACOMBE HOTEL is on the verge of the Atlantic, in its own Ornamental Grounds of Five Acres. It contains 250 Rooms and is a model of sanitary excellence. One of the largest Swimming Baths in England is attached to the Hotel and is now open for the season. Cheap Tourist Tickets to the Hotel for Two Months from all principal Railway Stations.—Times and every information of MANAGER.

VERNON'S PATENT CHINA and GLASS COMPANY, LIMITED.

The Public are invited to inspect an Assortment of Articles Exhibited at 93 Regent Street, W.

CAPITAL £30,000, IN 6,000 SHARES OF £5 EACH.

Of which 1,200 Shares are reserved as part payment to the Vendor.

1,500 Shares have already been applied for by the Directors and their Friends.

Payment as follows:—£1 on Application;
£2 on Allotment;
£1 on July 31, 1881;
£1 on August 31, 1881.

Directors.

The Right Honourable the Earl of GALLOWAY, Cumloden, Newton Stewart, N.B., and 17 Upper Grosvenor Street, London (Chairman).

ROBT. VANS AGNEW, Esq., Barnbarroch, Wigtonshire, N.B.

WM. MCCHLERY, Esq., Balmminoch Lodge, Kirkcowan, N.B.

JAMES DREW, Esq., Doon Hill, Newton Stewart, N.B.

JAMES WILSON, Esq. (Ex-Provost of Govan), West India Merchant, Glasgow.

ERNEST ZUCCANI, Esq., 41 Brick Lane, Spitalfields, London.

Patent Superintendent.

Messrs. J. M. TAYLOR & FOULIS, 180 St. Vincent Street, Glasgow.

Secretary and Manager.

(To be Nominated by the Directors.)

TEMPORARY OFFICES: 93 REGENT STREET, LONDON, W.

ABRIDGED PROSPECTUS.

THE Company is formed for the purpose of purchasing from Mr. JAMES VERNON the Patents which he has obtained in Great Britain and Ireland, France, Germany, Austria, Italy, Belgium, Hungary, and the United States, for attaching a projecting edge of Indiarubber to the base of Glass, China, Earthenware, Bronze, and similar articles.

The effect of this simple addition is of the most surprising and important kind. Noise in use is almost entirely prevented, and the risk of breakage is very largely diminished, partly by the prevention of jar on the article being set down, and partly by very much diminishing the tendency to slip. The latter advantage is invaluable for the use of brittle articles on board ship, for, if fitted according to Mr. VERNON's patent, they will retain their position on a table inclined at an angle which would throw ordinary glass or earthenware on the floor.

In hospitals and sick rooms the invention is peculiarly valuable in diminishing noise of a very irritating kind, and even in ordinary domestic life the pleasantness of having the ordinary clatter silenced is considerable.

The cost of applying the invention is small. It has been tried by several of the leading earthenware manufacturers with entire success, and the samples produced have received approval in the most distinguished classes of society.

The Company has entered into an agreement with Mr. VERNON, and his two brothers, SAMUEL VERNON and ANDREW VERNON, dated June 18, 1881, by which he agrees to sell his Patents to the Company for £10,000 in cash and £6,000 in fully paid up Shares; and he and his brothers bind themselves to give, without salary, for two years, such time and attention as the Directors may require for developing the Patents.

The only Contract entered into, except that with Mr. VERNON, mentioned above, is the following:—May 23, 1881, Messrs. EGAN & FLETCHER of the one part, and Mr. VERNON of the other part, agreement to take Show Room at 93 Regent Street.

Applications should be lodged at the London and County Bank, London, or the British Linen Company, Queen Street, Glasgow, or Newton Stewart, with a deposit of £1 per Share applied for.

Copies of the Memorandum and Articles of Association, and of the above mentioned Agreements, can be inspected by any intending Subscriber at the Offices of the Company, 93 Regent Street, London, W.; Messrs. J. M. TAYLOR & FOULIS, 180 St. Vincent Street, Glasgow; or A. B. MATTHEWS, Esq., Newton Stewart; at all which places Prospectuses and Forms of Application may be obtained.

Offices of the Company: 93 Regent Street, London, W.

THE LAND BILL.

IT was easily seen by those conversant with politics that the division on Mr. HENEAGE's amendment was a moment of great importance in the history of the Land Bill. The course of measures which, without enlisting the sympathies of Parliament or the nation in a pre-eminent degree, are eagerly forced along by a powerful Government against determined opposition is almost always uniform. In the earlier stages the mere weight and volume of the ordinary majority carry them on. But the multiplied divisions of Committee break and spend this force. Individual members begin to allow themselves liberty on points which do not seem vital, and sometimes end by extending that liberty very considerably. The strange attempt of the Birmingham Caucus to dictate to the Liberal party is not likely to check this disposition. In such cases a Government must be very strong or very lucky if it escapes compromise or disaster, and it can hardly escape the latter except by accepting the former. The name of Mr. HENEAGE may not be destined to the same immortality as that of Lord DUNKELIN; but his amendment, unsuccessful as it was, was accepted by the Government as a warning to shorten sail. Their majority was saved only by the dangerous and doubtful assistance of the Irish irreconcilables; and, if the immediate followers of Mr. PARNELL had abstained from voting, the victory would have been with the Opposition. No one who was acquainted with Mr. GLADSTONE's idiosyncrasy could doubt, when the PRIME MINISTER spoke of the rock which had so nearly wrecked him as "a point of the smallest importance in the opinion of HER MAJESTY's Government," that HER MAJESTY's Government would very shortly express their practical opinion in a different way. The point might be of very small importance, and indeed the number of English managed estates in Ireland is not asserted to be very large by anybody. But the sense of the House on the point was of very great importance, and the Cabinet appreciated it with an alacrity which is almost their first symptom of recovery from the somewhat dangerous condition of confidence and complacency in which they have rested since their accession to power.

The concessions which Mr. GLADSTONE announced on the day after the division were hardly of more importance than the general change of attitude towards amendments which he discovered, not merely then, but during the discussions in the earlier part of the present week. It has frequently been pointed out that opposition to the Bill arises not merely from the sense of the injustice of parts of it to Irish landlords, nor merely from the conviction of the harm which it may do to the general prosperity of Ireland. The cause of quarrel lies, almost as much as in either of these things, in the attitude which the Government have taken up in their obstinate refusal to explain where explanation was requested and in the overbearing fashion in which they have used their majority to rebut, without a hearing and without an argument, proposals obviously containing much that was reasonable and just. Their weapon nearly broke in their hands on Thursday week, and since that day they have been much more careful in the use of it. The two great concessions made at the end of last week relate to matters which formed a principal part of Mr. GIBSON's powerful criticism of the measure at the very beginning of the discussion. The argument that the landlord, as well as the tenant, ought to have direct

access to the Court, and that it was in the highest degree impolitic, as well as unfair, to throw on the owner the odium and the risk of raising his rents on his own responsibility and at heavy penalties, had been again and again advanced, only to be pooh-poohed and ignored. The argument that the directions to the Court in Clause 7 make it almost certain that a slice of the landlord's property would be awarded to the tenant had been even more frequently urged, and had met with even less respectful treatment. This is the more surprising as it is now known from Mr. GLADSTONE's own account that the Cabinet had not originally intended to insert the obnoxious words, and that the construction placed on those words was not that which they intended. In such a case it might have been thought that the earliest opportunity would have been taken to remove an obvious and useless stumbling-block. But it would appear that Mr. HENEAGE's amendment was a more convincing and illuminating force than all the objections of the Opposition critics. A third important concession was the omission of the penal directions in Clause 3; and this, too, might with advantage have come earlier, though it is perhaps unwise, as well as ungracious, to criticize too minutely in such matters. Of greater importance indirectly, though not of such direct moment, was the distinct admission of the PRIME MINISTER that a tenant's improvements, even if made by himself, cannot be considered as exclusively and entirely his own property. It is no wonder that this provoked not a little grumbling from the Irish members, inasmuch as it is a distinct return to the saner view of the relations between holder and owner, as compared with that which the Bill generally displays. So, too, in regard to the vexed and difficult question of the distinction between present and future tenancies, the indication of a preference for the retention of the latter as a possible road to the re-establishment of free contract in Ireland is a mercy small indeed, but still to be accepted not without thankfulness. It is true that the intimation lays the Government open to a damaging attack on the general policy of their Bill. It is true also that there is weight in the objection made by Mr. CLARKE and others to the establishment of an invidious and damaging distinction between two classes of tenants in a country where distinctions of any kind are so eagerly resented as in Ireland. But the prospect of a return to the principles of reason as opposed to those of the "present tenant" clauses of the Land Bill is perhaps too tempting to be readily abandoned, though some persons may think that this return is more likely to be effected by the failure of the measure than by its success. The uncertain and vacillating utterances of Mr. GLADSTONE as to the question of arrears were almost the only unsatisfactory points in a series of discussions which, if its results are not subsequently reversed, will have done much to modify the mischievous parts of the measure as it originally stood.

If the same attitude of compromise is maintained during the discussion of the rest of the earlier and more contentious parts of the Bill, it is obvious that its passage will be very materially facilitated. Tenant-right is, it is true, still undefined. The composition of the Court, upon which so much depends, is still unknown, and the obstinacy of the Government on Clause 1 has given sanction to several minor and incidental provisions tending to the injury of landlords and not too consistent with the subsequent modifications which have been, or are to be, intro-

duced. But what a short time ago seemed impossible has now come within the range of possibility. A great and not obviously deserved dead lift will be given to the present generation of tenants in Ireland, at the expense, indeed, of the landlords, inasmuch as every such dead lift must be at the expense of somebody, but not so unjustly at their expense as would once have been the case. Artificial arrangements will prevent the eagerness of the occupier from putting large sums into the pocket of the owner. The same arrangements will secure that these sums shall still be paid, but to the present tenant, not to his landlord, and (if the Court acts fairly) the actual rents of Ireland will on the whole be very largely raised. A considerable exodus of present tenants with the bonus secured to them by the Bill has even been prophesied with some plausibility. The relations of confidence between landlord and tenant must cease altogether, and a purely business relation precluded by the law from passing into that of tyrant and slave, but also precluded by the law from passing into that of patron and client, must take its place. A few cases of great hardship and injustice to proprietors must almost certainly occur; absenteeism is likely, in the nature of things, to become common, and a considerable peasant proprietary heavily burdened with debt may arise. This is, on the face of it, the probable result of the Bill in its present shape, and whether it is a result economically desirable or politically satisfactory must be left to individual opinion to decide. The effect of the measure on Irish agitation is less dubious, but the discussion of it is hardly in place at this particular moment. Behind every Irish demand there has hitherto sprung up at its satisfaction a new demand, less reasonable than the preceding. There is no reason to doubt, but on the contrary every reason to believe, that the successor to the "Three Fs" is perfectly ready to take its place.

THE TRANSVAAL.

IT is not to be regretted that the Commissioners in the Transvaal are out of reach of directing telegraphic despatches from Downing Street, as during the much more important negotiations at Washington, the Cabinet would probably solve every difficulty which was reported by the easy method of communicating immediate submission. The English representatives will probably be less flexible, especially as one of them has at his disposal the means of enforcing an equitable settlement in the contingency of an absolute rupture. There is no reason to fear that Sir EVELYN WOOD will recur to force except under the pressure of necessity. Since his protest against surrender was overruled, a new contest would not atone for the timid policy of the English Government. As the negotiations have not hitherto been discontinued, it may be presumed that the English Commissioners are satisfied with the credentials of their Boer colleagues. The doubts which have been expressed as to the intention of their constituents to be bound by agreements concluded by the leaders will only be solved by experience. Unless the successes which were unfortunately obtained by the insurgents in the late petty war have inspired them with undue confidence, it is difficult to believe that a body of prosperous farmers would willingly incur the risk of an unequal struggle. The Boers appear to have drifted into rebellion through the negligence and inconsistency of the English Government; for the present leaders had, with one or two exceptions, both submitted to the annexation and taken office under the English Government. They will probably be satisfied with the restoration of the form of government which they have persuaded themselves to admire since it ceased to exist, and to regret because they had lost it.

It may be hoped that a report of negotiations supposed to be instituted by the Boers with the Portuguese of Delagoa Bay is unfounded, though it is not improbable that some of the adventurers in the country have been guilty of officious intrigues. One of the few direct instructions which were addressed by Lord KIMBERLEY to the Commissioners prohibited them from conceding to the Transvaal Government the control of foreign affairs. The leaders had themselves more than once offered to submit themselves to a restriction which is obviously reasonable. The Portuguese in the mother-country are at present in a state of groundless irritation with England on account of the treaty for the establishment of a naval station at Lorenzo Marques, in the neighbourhood of Delagoa Bay. It is not impossible

that mischief-makers may have taken advantage of the trivial outburst of temper to attempt some interference with English interests. It was mainly for the benefit of the Transvaal that the English Government sought to acquire a port on the South-Eastern coast; but the Boers can hardly contemplate the conversion of their little pastoral community into a maritime State. The introduction of European politics and diplomacy into South Africa would be an intolerable nuisance. The genuine landowners of Dutch or Huguenot descent are profoundly ignorant of international affairs; but foreign agents might not improbably cultivate their jealousy, and keep alive hostility to the English Government. The representatives of Boers will probably not insist on any pretension to the right of making alliances and treaties. On the other hand, Lord KIMBERLEY cannot have intended to raise the native tribes to the conventional equality which belongs to civilized foreigners. It will be more invidious to retain a protectorate over the coloured race than to claim the right of exclusive intercourse with European States. The absolute control of their own domestic affairs which has been promised to the Boers is practically incompatible with an English protectorate of the natives within their borders. The Transvaal farmers have never affected to share the philanthropic sentiments which are popular in England. An article in the constitution of the neighbouring South African Republic expressly provides that the natives shall not be admitted to social or political equality.

The best security for the good treatment of the coloured subjects of the revived Republic is to be found in their formidable numbers. They outnumber the white inhabitants, including the loyal English settlers, in the proportion of twenty to one. The same considerations will prevent the Boer negotiators from agreeing to Lord KIMBERLEY's suggestion that the relations with the natives should be superintended by the English Resident under the directions of the High Commissioner. It is still doubtful whether the Boers will assent to the appointment of a Resident if he is to be invested with any but ceremonial functions. They will certainly refuse to confer upon him powers which would bring him into constant and, perhaps, successful collision with the local Government. The intended provisions against war with independent tribes will present complicated difficulties to the negotiators. If the rare communications of newspaper Correspondents may be trusted, the Transvaal leaders and the people in general vehemently oppose the scheme of detaching strips of territory thickly inhabited by natives from the restored Republic. It is not to be expected that their objections, however unreasonable, will be overcome. It is, indeed, absurd that a community of forty thousand men, women, and children should think itself aggrieved by the surrender of districts occupied by hostile and warlike aliens, when it would still leave the Boers in possession of a country larger than the United Kingdom; but in modern times geographical generalizations have almost as much influence as still more new-fangled ethnological speculations. M. JULES FAVRE's patriotism was at least intelligible when he refused to cede a foot of French soil or a stone from a French fortress. The claim of a handful of settlers to a large patch of the map of the world is less respectable, but it may perhaps be more obstinate. Only a few years ago the colonists of New South Wales and Victoria threatened rebellion because convicts were, with the assent of the local Government, transported from England to the province of West Australia, a thousand miles off.

It is possible that in some of the discussions both parties may unintentionally contend for arrangements which would be respectively injurious to themselves. It is not for the interest of the English Government to enlarge beyond necessary limits the nominal powers of a Resident who will have no means of enforcing his decisions. Although Pretoria is less barbarous than Cabul, the English representative might in imaginable contingencies be treated as a hostage. He would at the best be exposed to the constant mortification of finding his counsels and his remonstrances neglected. The responsibilities which may be incurred by stipulations on behalf of native tribes within and without the Transvaal will almost certainly involve serious liabilities to the Boers, or to the coloured race, or to both. Lord KIMBERLEY may be right in holding that the Boers ought to recognize the independence of the Swazis, and to assent to the positions assigned to the

Zulus after the recent war; but the Boers formerly claimed some kind of sovereignty over the Swazis, and they will probably reassert their pretensions. Of the feelings of the natives within and without the Transvaal there appears to be no doubt. Many of the chiefs during the short war offered their services to the English authorities; and they were probably disappointed by the order that they should remain at peace unless they were first attacked. Nothing would be easier than to promote a general rising against the Boers; but a civilized Government cannot connect itself with barbarous allies. On the whole, it will be expedient to interfere as little as possible in the quarrels which are almost certain to arise. The English Government ought to keep aloof from disputes with the natives; but it is bound to use all possible efforts for the protection of English residents and loyal Boers. As the Dutch appear never to have competed with the English settlers in commerce or in other urban occupations, there seems to be no reason why they should now ask to drive the English, who form about a seventh of the population, from the towns which they inhabit.

MR. BRIGHT'S PROGRAMME.

IN the debate on Sir WILFRID LAWSON'S temporary substitute for the Permissive Bill, Mr. BRIGHT, after explaining that the Government attached no special meaning to the phrase of local option, sketched out, as a member of the Opposition justly remarked, three or four future QUEEN'S Speeches. Most of the measures to which he pledged himself and his colleagues seem to be, in their opinion, more urgent than the suppression of retail dealing in fermented liquors. They all partake of the nature of organic changes, and they are almost all of doubtful expediency. Mr. BRIGHT took occasion to restore to Colonel PEYRONET THOMPSON the credit of the not very recondite illustration of the dozen omnibuses which cannot be driven side by side through Temple Bar. It is not to be taken for granted without inquiry that it would be desirable largely to increase the number of legislative vehicles. There is, indeed, always useful and unambitious work for Parliament to do, as, for instance, at the present day a change is by general consent required in the law of bankruptcy; but it was not with matters so uninteresting that Mr. BRIGHT proposed to concern himself. The constitution of the House of Commons had to be altered, the tenure of landed property was to be remodelled, and London was to be provided with a municipal government. It would seem that Mr. BRIGHT is not for the moment prepared to engage in the abolition of the English and Scotch Establishments, though he concurs with his colleague Mr. CHAMBERLAIN in his opinion of their demerits. Some time since Mr. CHAMBERLAIN told his Club or Federation that it mattered little whether efforts were first directed to the demolition of the Church or to the readjustment of landed property. The institutions of the country are to be destroyed in detail; and the choice of a point of attack is of secondary importance. The leaders of the subversive party may console themselves for the delay which is caused by the disquisition of the Irish Land Bill. When the measure is passed, they will find that the precedents and the habits of mind which it will have introduced are likely to operate far beyond the limits of Ireland.

One of the most dangerous measures in Mr. BRIGHT'S list will probably, whenever it is introduced, be carried with faint opposition. As Mr. BRIGHT said, the Liberal party is, with few exceptions, unanimous in its purpose of establishing a uniform suffrage, and of giving further effect to the change by a large redistribution of seats. Many Conservatives have from time to time professed to assent to a scheme which will reduce their party and their natural allies, the moderate Liberals, to political impotence. It was understood that Lord BEACONSFIELD was inclined once more to lower the franchise after the temporary and partial success of his former experiment. Few of his surviving adherents share his strange delusion that there is a Conservative stratum underlying the lower middle class with which he had never heartily sympathised; but some of them have a taste for political symmetry; and county members are reasonably unwilling to alienate their future constituents. There is little doubt that the measure will be passed by the present Parliament, though it may probably for obvious reasons be adjourned to the last Session before the next general election. Con-

servatives and moderate Liberals, including the majority of landowners, will submit to necessity without deceiving themselves as to the consequences of the measure. It may be allowed to contemplate with prospective amusement the disappointment of the tenant farmers who have been successfully converted by the present Ministry. They have superseded their landlords in the political control of the counties; and they are disposed to use their newly acquired powers for their own exclusive benefit. Household suffrage will at once transfer their political influence to the labourers, as it has already given the artisans supremacy in the boroughs. A less important class, consisting of a small and well-meaning section of Liberals, will also regret the exclusive preponderance which will be given to numbers. The advocates of extended suffrage and of redistribution have the same object with the French partisans of the *Scrutin de liste*, which is to disfranchise and silence minorities. When there are no small constituencies, and no constituencies of special and exceptional character, the recipients of weekly wages who think and act in masses will be politically supreme. It is uncertain whether they will pass a Permissive Bill; but they will certainly not be restrained by any respect for the rights or opinions of their neighbours.

The establishment of a metropolitan municipality would be a comparatively insignificant innovation, nor is the scheme demonstrably inexpedient; but Mr. BRIGHT'S arguments in its favour are neither conclusive nor practical. London, as he truly said, has a population which bears to that of Ireland the proportion of four to five; yet the vast multitude of four million residents has no corporate government of its own. He might have added that, although the Lord Mayor is almost as gorgeous a dignitary as the Lord-Lieutenant, London is not restrained from insurrection by an army of 30,000 men, and by a police with military organization. The metropolitan members are not sent to the House of Commons to talk sedition or to obstruct Parliamentary business. Householders, who seldom own the freehold of their dwellings, pay their rents at the appointed term. There is, in truth, no great city in the world which is better or more smoothly governed. The police, including the small City force, is in the highest degree efficient; and in times of disturbance it would be much more conveniently administered as at present by the Government than by a municipal body which might possibly be disaffected. It must be remembered that since the establishment of Mr. CHAMBERLAIN'S political system of monopoly and exclusion, the whole powers of municipal government may be placed in the hands of one political faction. In Birmingham Conservatives are subject to disabilities as sweeping and unjust as those from which Roman Catholics were relieved half a century ago. A London Corporation constituted on the Birmingham type would be at the same time an instrument of irritating tyranny and a dangerous rival to the national Government. The municipality of Paris, representing only extreme opinions, is always attempting to encroach on the functions of the Legislature and the Cabinet. A London Corporation would probably not imitate the Commune; but it might become troublesome and formidable. It will not be a universal evil if the block at the Parliamentary Temple Bar impedes for the present the passage of the municipal omnibus. The best result which could follow from its advent would probably be that the streets would be as well lighted and paved and perfectly as safe as at present. Sooner or later the experiment will be tried; and possibly it may do no harm; but the arguments which Mr. FRETCH and others urge against the maintenance of the City Corporation are conventional and unsound. It is to be regretted that Sir W. HARCOURT pledged the Government to a civic revolution.

The abolition or modification of settlements and entails of landed property will be undertaken by the present Government in the probable contingency of its retaining office for three or four years. The change, which is inevitable and perhaps expedient, will be effected against the wish of most of those whom it will in the first instance concern. There may indeed be some life tenants who, like Lord CARRINGTON, think themselves aggrieved by the limitation of their estates to a life tenancy with remainder to direct or collateral heirs; but the advocates of strict primogeniture, applicable only to their own cases, seldom have the candour to proclaim their dissatisfaction. It is for the benefit of aspirants to the possession of landed property, and not of the actual owners, that it may be advantage-

ously relieved from some or all of the impediments to the easy and frequent transmission of ownership. The collateral agitation of farmers who, with or without reason, persuade themselves that owners in fee-simple may perhaps be more liberal than their present landlords will contribute to the same result. When Mr. BRIGHT's measures have successively become law, and when Parliament is at last at leisure to investigate the meaning of local option, England may perhaps still be great and prosperous; but it will not be the country which is familiar to the present generation. All the proposed changes are in the democratic direction; and they are indeed promoted or desired mainly because they tend to augment the power of numerical majorities. Some prejudiced minds are not anxious to see in England a reproduction of American institutions without an American abundance of land and of material resources. The best part of Mr. BURTON's programme is the definite postponement of the Permissive Bill. It is much to be wished that the measures which are to be preferred to local option might encounter similar impediments.

TUNIS.

M. ST.-HILAIRE has written another Circular in which he once more goes over the ground he has traversed so often in recounting what has happened in Tunis. There is not, and there could not be, much that is new in it. M. ST.-HILAIRE still believes in the Kroumirs, and still speaks of the wonderful benefits the French are going to confer on Tunis. He is as far as ever from wishing for annexation. Nothing, as he says, could be more imprudent than for France to add two millions more of disaffected Mussulmans to the three millions she already possesses in Algeria. The task of France in Tunis is different from that which she has undertaken in Algeria. She is not going to rule Arabs, but to work Tunis to the profit of Tunis, of herself, and of foreign Powers. And she will be likely to do this easily, and she believes she has made an excellent start. She is pursuing everywhere a pacific policy, and nowhere has she shown this more conclusively than in Tunis itself. France, M. ST.-HILAIRE says, never quarrelled with the Bey. It never thought of declaring war against him, and he was not slow to comprehend the friendly intentions of his visitors. He signed a treaty whence nothing but blessings can spring to his country, if only it will receive them as they come. A pacific patient benefactress is the character in which France has really come forward, if only the world will but recognize what has really taken place. If M. ST.-HILAIRE likes to write in this way, no one can stop him; and it must be assumed that there are persons to whom his Circular is addressed, and who are expected to accept it as an accurate exposition of his policy. In very remote parts of France there may be electors who know little and think little, who have a dim sense that peace benefits them, and who will believe that it really is a pacific and benevolent proceeding to bombard the forts of a foreign prince, to collect troops round his palace, to present to him a treaty by which he gives up his independence, and allow him a couple of hours in which to sign it. Elsewhere this new Circular can provoke nothing but amazement and regret. French diplomacy has gone back into the worst of its old bad ways. It has relapsed into the fulsome style of the First NAPOLEON, whose profound contempt for mankind always impelled him to believe that no statements could be too audacious for fools to swallow. Why cannot M. ST.-HILAIRE describe in plain language exactly what has happened? Whatever he says, the facts remain precisely the same. By the exercise of overwhelming force France has made the Bey accept a protectorate to which he was extremely averse. France has had her own way; no one has interfered with her. She has thought it in her interest to establish this protectorate, and no one has thought it necessary to say a word against this very high-handed, and even brutal, treatment of a little potentate. She has no reason to conceal what she has done, for it is impossible to conceal it, and her acts have passed without remonstrance. It is not that the French have established themselves as masters in Tunis that her neighbours resent. It is the mode in which they got what they wanted; and, above all, the absurd mystifications and misrepresentations in which M. ST.-HILAIRE thinks it advisable to wrap up

the simplest facts that disgust and distress the best friends of France.

Out of such an act as the establishment of a protectorate by surprise and force there are sure to grow difficulties on difficulties, each of which may be small, but all of which require much tact, forbearance, and good temper to overcome, and any of which may some day have grave consequences. The animosity provoked by recent occurrences between the French and the Italians has taken the form of most serious disturbances at Marseilles. There are said to be 50,000 Italians at Marseilles, and in so large a number there are sure to be many turbulent spirits who are much too ready with their knives, and who, if excited, are very unpleasant neighbours. Whether the Italians began the rioting is doubtful, but very serious rioting broke out, which the authorities were unable to suppress; Frenchmen and Italians were wounded or killed; and the French mob, when it had got the upper hand, treated the defenceless Italians with insolent brutality. Both the French and the Italian authorities have exerted themselves strenuously to restore peace, and the Italian Government has suppressed with creditable firmness mob meetings at Genoa and Naples intended to stir up the spirit of the Italian nation against France. The Italian Government has recognized that it cannot afford to quarrel with France, and that, if it is not going to quarrel openly, it would only make itself ridiculous by sulking and getting up small controversies in which it did not intend to persist. The French protectorate in Tunis exists; and, as the Italian Government cannot undo an accomplished fact, it must make the best of a protectorate which it very much dislikes. It wants, too, to bring out as soon as possible its great loan, which is to restore Italian finance to its proper footing, and for success in this cordial relations between Italy and France are indispensable. The Government, therefore, very properly says that it will not at such a moment allow the conduct of the national policy to be taken out of its hands by irresponsible agitators, and will, if necessary, use its troops to put down any movement which endangers the friendship of Italy and France. But no Government can prevent the memory of what has taken place in Tunis and the treatment of Italians at Marseilles ranking in the mind of the Italian people. Probably Frenchmen will think that Italian indignation will soon blow over, or that, if it does not, it cannot much hurt France. It is quite true that Italy single-handed cannot hope to encounter France on equal terms. But so many changes and chances may happen in European affairs, there are so many elements of disturbance stirring, there are so many difficult questions unsettled, that it is impossible to say that the increasing feeling of hostility towards France which animates Italy may not some day bear unexpected fruit. By its latest exhibition of a pacific policy France has set the ball of commotion rolling, and it is a ball that may roll a long way before it stops.

There are also difficulties of a very different kind to which the French protectorate is giving rise. If France overwants a pretext for quarrelling with the Porte about Tripoli, it is sure now to have one always at hand. It is not only that the Tripoli Arabs may be accused of stirring up the Tunisian Arabs and the Tunisian Arabs of stirring up the Algerian Arabs, so that the French have got a new set of Kroumirs perpetually ready for them whenever it suits France to discover their existence; but France has already a dispute with Turkey about Tripoli, which is of a very curious kind. By the treaty with the Bey, the French exclusively represent Tunis, and protect Tunisians in every part of the world. The French Government has accordingly notified to the Porte that Tunisians in Tripoli will be protected henceforth by French diplomatic representatives. But, in the eyes of the Porte, Tunisians are subjects of the SULTAN, and, therefore, his subjects are to be represented in his territory by a foreign Power. It is scarcely possible that in the ordinary course of things there should not be Tunisians in Tripoli who will ask for French protection, and whenever the question is practically raised, France will have no choice but to insist on its right to represent those who claim its protection. To fail to do this would be to abandon the ground so vehemently taken by France, that the Tunisians are not, and never were, in the time of historical memory, Ottoman subjects. If France insists, the Porte must give way, but it will only give way under the pressure of extreme necessity, and because the French will

threaten to occupy Tripoli if it does not give way. The annexation—or, to use M. ST.-HILAIRE's euphemism—the civilisation of Tripoli will some day be found to be the logical consequence of the pacific policy of France in Tunis. There is, also, a more immediate cause of difficulty—the irrepressible M. ROUSTAN. He has made the BEY appoint him Tunisian Minister of Foreign Affairs, and he has notified to his diplomatic colleagues that they are to do all business through him. There appears to have been some confusion as to the position occupied by M. ROUSTAN, and it was supposed to alter technically the status of the diplomatic representatives of other Powers. But in name, at least, this is not so. The English Consul-General retains all his immunities. He can ask to see the BEY as much as he ever could, and is as sure to see him, and as sure to be told that the BEY will think over what has been said and will consult his Ministers before he gives an answer. What is altered is not the relation of the diplomatic representatives of other Powers to the BEY, but their relations to each other. They are no longer on an equality. There are now two M. ROUSTANS—one who is their colleague, and one who is to give them the answer of the Power to whom they are accredited—and they will never know which M. ROUSTAN they are addressing. Diplomatic representation would be impossible if such a double character was recognized in the person of one of the body, and the precedent is so dangerous that the English Government had no choice but to point out, as Lord GRANVILLE says it is doing, to the French Government the inconveniences of the course taken by M. ROUSTAN. It is not, however, the preponderating influence of M. ROUSTAN that we can object to. If he remained Foreign Secretary and had a friend who was another self as Consul-General, his influence would be undiminished, but there would be no good ground for objecting to the arrangement when once we have accepted the French protectorate. It is only the precedent of inequality among diplomatic representatives that is a cause of serious remonstrance.

FREE-TRADE.

IT is to be regretted that for the first time in nearly forty years the principles of Free-trade should become subjects of controversy in England. The vindication of reciprocity or retaliation is passing from mere blunderers and simpletons into the hands of ingenious champions of paradox, who habitually, and often not without reason, suspect the soundness of popular commonplaces. Experience has shown that in almost all civilized communities the concentrated selfishness of producers prevails over the diffused interests of consumers. The profit to be obtained by a comparatively small number of vendors is more intelligible or more visible than the advantage conferred by cheapness on the multitude of consumers. Manufacturers in many countries succeed in persuading their customers that the national wealth is augmented when a profitable market is provided for native industry. It would seem that either an exercise of imagination or a faculty of generalizing is required to apprehend the simple proposition that it is wasteful to pay more for any commodity than it is worth. Americans, Frenchmen, Russians, and Australian colonists agree in the policy of subsidizing, at their own expense, the producers whom they suppose to be identified in interest with themselves. When for special reasons England remained exempt from the general fallacy, it was proved in many elementary treatises that it would be cheaper to pension off privileged manufacturers than to buy their goods at an artificial price; but the belief in sound doctrines really rested not on conclusive arguments, but on casual circumstances. The educated classes became convinced at the time when the masses were converted by appeals to their social prejudices. The accidental alliance of democracy with political economy alone caused the triumph of Free-trade.

The old system of colonial monopoly was not in itself wholly irrational. The sovereign community made no pretence of consulting the interest of its dependencies when it required them to confine their purchases to English produce. The converse preference which was given in the home markets to colonial sugar or rum was an unconscious sacrifice on the part of the mother-country. The total or partial exclusion of foreign corn from English markets had

a more plausible excuse than almost any other instance of Protection, though it was both pernicious and unjustifiable. In conceivable cases it might be advantageous to rely for the necessities of life on domestic supplies, for the exclusion of foreign imports by a combination of enemies who might acquire the command of the sea would now produce severe distress. Nevertheless, it was on the whole worth while to run the risk of a remote risk for the sake of removing a chronic grievance. It would probably have been impossible to abolish the Corn Laws, if land had been subdivided in England as in France. Mr. COBDEN and Mr. BRIGHT had the great advantage of directing their attacks against a small privileged minority. Those who were contemporary with the Corn Law League remember the animosity which its leaders expressed against the aristocracy, which, as they said, took advantage of its political power to tax the community. It was no part of their contention to remind their disciples that a larger and more powerful body of landowners would have been more formidable opponents. Mr. COBDEN was a sound economist as well as an effective agitator; but the tradition which represents him as a disputant who relied wholly on commercial arguments is altogether fictitious. Fortunately for his purpose, it happened that the majority of English manufacturers cared at the time but little for Protection. Except in certain articles of luxury, they were not liable to be undersold at home, and in neutral markets no tariff could help them. The victory of the Corn Law League, culminating in the conversion of Sir ROBERT PEEL, determined the opinion of the general community for a whole generation. The most considerable survivor of the Corn-law agitation is not yet tired of fighting over his early battles on all possible opportunities. Not long since Mr. BRIGHT publicly gloated over an imaginary picture of landlords who, in his judgment, might have had to fly for their lives if they had persisted in their opposition to the League. It is perfectly true that they were fortunate and well advised in recognizing like the less powerful combatants in the Iliad and the Paradise Lost, the rising scale which indicated the futility of further struggle.

It would be unjust to blame Mr. COBDEN for the partial failure of his later enterprise. His anticipations of the result of the French Treaty have been particularly disappointed; but he is more open to criticism as an economical heretic than as a false prophet. In concert with the Emperor NAPOLEON he deliberately countenanced a popular delusion when he balanced reductions of the English tariff against corresponding, though unequal, concessions on the part of France. If a sagacious ruler thought himself obliged to deal with his subjects as children, the negotiator on the other side hoped not unreasonably that they would learn by experience how far their representatives and teachers had been wiser than themselves. It now appears that the curriculum of economic study has not been long enough, though it has extended over twenty years. Republican France has not advanced as far as the Imperial Government of 1860. French newspapers affect with foolish bluster to resent the surprise and irritation which have been caused in England by the discovery that Continental communities and Governments have, like the restored BOURBONS, learned and forgotten nothing. On this side it is undoubtedly true that, according to the current and questionable figure of speech, a wave of reciprocity is beginning to rise and to spread. It is not even impossible that, if the French Treaty now in process of negotiation fails, attempts will be made to increase the duties on French wines and spirits, and perhaps on silk manufactures. The country will not be ruined either by an addition to the price of claret or by the increased cost of fashionable dresses; but the change, as far as it operates, will be injurious, and the angry feeling which it will excite will confirm the belief of Frenchmen that England has been converted to the doctrine of Protection. The community would be more prosperous than at present if foreign countries would have consulted their own advantage by a rational system of commercial intercourse; but comparative penury is not a reason for making bad bargains or creating a factitious dearth. Nearly a hundred years ago PITT, according to the statement of Lord GRANVILLE, had formed a plan for the total abolition of Customs duties. If he had not been prevented by the war of the French Revolution from executing his design, he might perhaps have induced all other nations to follow the example of England. They are now engaged in a servile imitation of an ob-

solite English stage of progress; and perhaps, if they are let alone, they may ultimately prefer the more modern example. It is in any case not desirable to turn back to meet them.

If the more enlightened apologists of retaliation will consider the details of any possible war of tariffs, they may satisfy themselves that any increase of Customs duties which would be tolerated at home would be far too insignificant to coerce foreign monopolists. It is admitted on all hands that the vast amount of imports which consists of articles of food must remain wholly exempt from taxation. Raw materials of manufacture form another exception to the possibilities of fiscal experiment. There remain such articles as wine and silk, of which neither is exclusively a French production. Increased duties on claret and champagne would operate as gratuitous boons to Spanish and Portuguese wine-growers, unless the general rate of taxation were increased. If all wines were made artificially dearer, brewers, who have not lately been favourites of legislation, would perhaps obtain a share of the profit. The annual trade returns, though they might be more satisfactory, indicate no considerable or permanent decline in commerce and industry. It is a hardship that great and rich markets should be wholly or partially closed to English produce; but the amount of exports is enormous in comparison with the totals of twenty years ago. It is true that the Free-trade propaganda has not been brilliantly successful; but it is possible that, if one great commercial nation continues to consult its own interests, other countries may in turn follow its example. If not, there is no reason for copying their wasteful ignorance. Even in France there seems to be a perceptible reaction against the policy which has dictated the General Tariff. Some Chambers of Commerce have represented to the Legislature that the failure of negotiations for a commercial treaty will be injurious to some classes of French manufacturers. It would have perhaps been injudicious to suggest that the consumers or the French people in general are also entitled to consideration. The unusual coincidence of popular opinion with sound principle, which has been produced in England by special causes, ought to be carefully cherished.

THE CHANNEL TUNNEL.

THE controversy about the Channel Tunnel has advanced a stage. At a meeting of the South-Eastern Railway Company last week Sir EDWARD WATKIN took occasion to describe the position in which the experiment now stands. The shafts already sunk have shown good reason for thinking that there exists underneath the Channel a stratum which water cannot penetrate. In the course of the year it is hoped that two miles—one on each side of the Channel—of an experimental tunnel, seven feet in diameter, will be constructed. When this has been accomplished, Sir EDWARD WATKIN intends to propose that the English and French promoters shall each carry this experimental tunnel nine miles further. If they can meet beneath the middle of the Channel, the whole question, in Sir EDWARD WATKIN's opinion, will be settled. Until that day arrives, neither the French nor the British investor will be asked to embark his capital in the venture. The expense has hitherto been borne by the heroic proprietors of the South-Eastern Railway Company. Theirs has been the sacrifice, and theirs will be the reward. When the tunnel is made, the South-Eastern Railway will be part of a direct line extending from the North of Scotland to the extreme South of Europe, and will not that be a pretty property to set before a railway shareholder?

Sir EDWARD WATKIN no doubt thinks it strange that any one can be found to deal discouragement to so promising an enterprise. But the day after the report of the meeting appeared the *Times* made the cruel suggestion that the project of a Channel Tunnel has two faces, and that the uses to which it may be turned in time of war are not equally attractive with those to which it is proposed to turn it in time of peace. "The tunnel, with both ends in hostile hands, would be a safe passage ready made for the invader." The French end will certainly not be in our hands, and conceivably therefore it may be in hostile hands; and "will it be possible for us so to guard the English end of the passage that it can never fall into any other hands than our own?" At all events, whether it were ever

turned to the account of an invader or not, the country would never be free from fear that it might be so turned. The tunnel can be had, but it can only be had at a price, and that a price which must be paid by others than those who will profit by the shortening of the journey to Paris or by the higher fares which may be charged for the accommodation. To this objection Sir EDWARD WATKIN has two answers, one moral, the other material. The moral answer is that "every civilized country, knowing that the means of attack, if any, would be mutual, if not equal, would be ready on the demand of England to make the tunnel sacred ground in time of war." The material answer is that "a pound of dynamite, or the opening of a well-devised sluice, would render the tunnel impassable." As regards the first of these contentions, it does not give us anything like the comfort which it seems to give Sir EDWARD WATKIN. We are not sure that every civilized country would be ready even to declare the Channel Tunnel sacred ground in time of war. A great many civilized countries might be willing to do this much, but then everything would depend on who the recusants happened to be. We might secure the desired declaration from Holland, Belgium, Denmark, Greece, Sweden, and Roumania, and Sir EDWARD WATKIN might thereupon remark, with perfect truth, that a majority of the Continental Powers had consented to neutralize the tunnel. But if Germany and Russia had merely observed that it was no affair of theirs, Sir EDWARD WATKIN would probably find that the impression made on his countrymen by what he calls the hobgoblin argument was not greatly lessened. Supposing, however, that all the Continental Powers had conceded our demand, what would be the security that the concession would be effective? What usually happens is that, as soon as it becomes convenient to any Power to disregard an arrangement of this kind, it is disregarded, and each of the guaranteeing Powers then considers for itself whether it is worth its while to keep its promise. If it is not worth its while, it writes a few strong despatches, and warns the offender that, though no harm may come to him this time, he must not presume upon any similar impunity in the future. After this, perhaps, a Conference is held, in which it is agreed that the understanding shall hereafter be regarded as suspended in all cases in which any one of the guaranteeing Powers shall decline to be a party to enforcing it.

Sir EDWARD WATKIN's material answer is more to the purpose. The probability that the tunnel could be used by an invader in anticipation of a declaration of war is very small; and, as soon as war had been declared, the pound of dynamite or the well-devised sluice might at once be called into play. Sir EDWARD WATKIN forgets, however, that to make the tunnel useless before we had ascertained whether it would be protected by the neutral Powers would, with reason, be regarded as showing distrust of their intention to remain neutral, so that it is conceivable that a daring invader might turn the tunnel to some account even after a declaration of war. Supposing, however, that the dynamite or the sluice had done its work, how long would be needed to undo it? This is really a more important consideration than any other, because it bears upon the real use to which the tunnel would be put by an enemy if it should ever be used at all. There is not much reason to fear that an invading army will march through the tunnel, and establish themselves at Dover. But there may be real reason to fear that an invading army, having effected a landing on our shores, might seize the tunnel, repair it if injured, and then use it as a means of maintaining its communications. This is admitted, curiously enough, by a writer signing himself M.P., who is nevertheless of opinion that "as a practical matter the only question which either the promoters of the tunnel or the public need ask is 'Will it pay?' not 'Will the French invade?'" "Of course," he says, "if our supposed enemy had the command of the sea, and were in a position to land 100,000 men upon our shores, the possession of the tunnel would give him an immense additional advantage." We should think it would. The possession of the tunnel would destroy the value of our second line of defence. It cannot be thought impossible that an enemy having secured, by deception or force, the temporary command of the sea should land 50,000 men upon the English coast. But what hitherto has been thought impossible is that these 50,000 men should be able to advance far inland without being annihilated by a defending force greatly superior in

numbers, though not in training. Now this impossibility will count for nothing if successive armies of 50,000 men can be passed through the tunnel. The whole advantage of our insular position would then be lost. After once the landing had been effected, and the tunnel repaired, the process of invasion would be reduced to a mere crossing of an imaginary frontier underneath the sea.

It is essential, therefore, to the security of the tunnel from a military point of view, that it should be capable at a moment's notice, not merely of being rendered unusable for a time, but of being virtually destroyed. Even then its existence would be a source of just uneasiness, because we could not feel certain that the natural unwillingness of the Government to destroy so costly an undertaking might not lead them to delay giving the order for destruction until it had become impossible to execute it. The question which Parliament will have to consider when the experiments have been concluded, and the possibility of constructing the tunnel demonstrated, is this. Is it worth while to run any risk at all in a matter of such inestimable importance merely to save travellers from sea-sickness, to place English newspapers on the breakfast-tables of the people of Paris on the morning of publication, and to make the South-Eastern Railway a magnificent property? That Parliament will say No to this question in the end is not perhaps improbable; but in that case would it not be well to spare the promoters of the tunnel the cost and trouble of making further experiments?

OPIMUM IN BURMAH.

THE use or abuse of opium has done so much harm in Burmah that the authorities find themselves compelled to place new restrictions on its consumption. Whatever could be done to lessen the consumption by artificially increasing the price has been done. There are very heavy import duties on opium, and still heavier duties on the sale in the shape of taxes for licences to keep opium houses. In one way or another the selling price in Burmah is ten times what the drug costs when it reaches a Burmese port. It was thought that by thus enhancing the cost, the general consumption of opium would be checked, while there would be enough to meet what is termed in the Report of the Chief Commissioner a *bonâ fide* demand, and that the revenue would gain all that could be gained for it without provoking a system of illegitimate supply. But in one respect these expectations have been signally disappointed. The revenue has largely profited, and the *bonâ fide* demand has been amply provided for, but the general consumption has not been checked. On the contrary, the consumption in 1879 was double what it was in 1869, and the consequences have been most lamentable. To the Burmese opium was a novelty, and it had all the attractions of a novelty and of a thing which it was at once pleasant and wrong to enjoy. A race physically weak, having no personal or hereditary power of bearing the ill effects of opium, ignorant of the consequences of indulgence, or reckless of those consequences when placed beyond doubt, was sure to exhibit in the shortest possible time all the worst evils that excessive use of opium can engender. What these evils are is summed up tersely and effectively in the Report. Among the Burmese, it is officially stated, the habitual use of the drug saps the physical and mental energies, destroys the nerves, emaciates the body, predisposes to disease, induces indolent and filthy habits of life, destroys self-respect, is one of the most fertile sources of misery, destitution, and crime, fills the gaols with men of relaxed frame, predisposed to dysentery and cholera, prevents the due extension of cultivation and the development of the land revenue, checks the natural growth of the population, and enfeebles the constitution of succeeding generations. There are one or two touches in this dismal picture which betray the special hand of an official, such as the complaint that prisoners are not as healthy as the State ought to have them, and that opium interferes with the land revenue. But there can be little doubt that the general blackness of the picture is not overcharged. One Commissioner, indeed, says that he looked in vain for the victims of opium. He everywhere heard of them; but he everywhere heard that they were to be found in the next village. The balance of testimony is, however, very strongly the other way. Commissioner after Commissioner

reports that in his district, wherever opium is used, material prosperity is going rapidly backwards. A sufficient case is made out for the interference of the Government. It is proposed that opium shall still be sold, but that it shall be sold in much fewer houses, and that it shall only be consumed in licensed houses. It might seem that this latter provision would be very difficult to enforce practically; but those who propose it know perfectly well the people to whom it is to be applied, and they evidently think that the Burmese will not venture to evade what they are told is to be the law. Less opium will, it is calculated, be sold, and the revenue will suffer; but, as it will only suffer to the extent of 50,000l., the loss is one that may easily be borne.

What is chiefly interesting in the Report is the general attitude of the English officials towards opium, on the one hand, and that of the more respectable natives on the other. The officials have no kind of prejudice against opium, and they have a very tender care for the revenue. When we read the long list of awful evils which the abuse of opium entails, we might expect that the officials who testify to the existence of these evils, and who seem out to the heart by the tale of woe which they themselves unfold, would curse opium altogether, desire that no opium should be sold, and would rather lose the whole revenue which opium provides than allow the people to go on suffering another day from evils which the Government could stop if it pleased. As the Government can now ensure that all opium brought into Burmah shall pass through the Custom House, and as the authorities think that they can so watch over the population that henceforth no one shall use opium in private, it is obvious that the Government could, if it chose, stop the use of opium altogether. But the officials are not at all in the temper of heated philanthropists. This, in fact, is a temper to which officials in all parts of the world are the last of men to give way. The Burmese officials fully recognize that there is such a thing as a *bonâ fide* demand for opium, and are very pleased that the revenue should gain by the demand being adequately supplied. This *bonâ fide* demand means the demand of persons who can take opium without its doing them much harm. In Burmah there are many Chinese, to whom opium is a necessary of life, and the Chinese, as the officials assure us, are not hurt by opium. They do not make themselves offete with opium, they do not lessen the stream of healthy prisoners, they do not check the wholesome growth of the land revenue. They have learned by long practice how opium ought to be taken. If they stupefy themselves, they only stupefy themselves as much as their practised and hardy frames can bear. This is, in many ways, instructive and satisfactory. We may hope that when we grow opium in India for China we are not only getting a handsome revenue for ourselves, but are giving a harmful product to people who do not get much harm from it. Some people, as the evidence from Burmah shows, can take opium and some cannot. What is true of the Chinese in Burmah may be true of some natives. The evidence of the Commissioner who could never find the supposed victims of opium may at least be taken to show that in some districts some Burmese take opium without harm. These natives and the Chinese are those whose anxiety to buy the drug constitutes the *bonâ fide* demand for it. Their wishes are to be gratified. Total abstinence is not to be imposed on them because other persons are not so prudent or so hardened as they are.

The respectable part of the Burmese population is very strong in its denunciation of the evils of using opium, and would be delighted to see the Government take more extreme measures than those now proposed. They look on the use of opium as a distinct contravention of their religion. They are taught to think that so mischievous an indulgence is sinful, and the sin of using opium is one from which they have not to wean themselves, but one which is unknown to them, and is a novelty in their country. There can be no doubt that, if British Burmah ruled itself, it would altogether prohibit the use of opium, and it is the English Government that refuses them the local option which they would quickly exercise if they were permitted. Nor in their eyes does this legalization of a sin stand alone. It is a part of a new order of things before which the old order is crumbling away. In countless ways the population is feeling the shock of Western ideas, and the influences of ancient custom, tradition, and religion are fading away. If Burmese of the old school cannot stop the tide of inno-

vation, they can mourn over it and make their wailings heard. To them it means the end of all they know, trust in, and believe in. When men in whose minds a peculiar system of ideas and belief has been ingrained are looking on at a general decay and collapse of all that they are accustomed to and venerate, the legalization by conquerors of what they held to be a sin seems especially awful and monstrous. They see in it the handwriting on the wall which plainly foretells their doom. In the case of opium they have the advantage of being able to point to consequences the gravity of which is conspicuous, whether using opium is treated as a sin or not. They can ask the Supreme Government whether it can endure that the population of which it has charge shall wither away under its eyes. Very naturally they make the most of such evil consequences of using opium as they can point to; and they can point to many as to which those to whom they appeal have no doubt. But the natives of the old school and the Government, although they are working towards the same end in restraining the use of opium, are working on very different lines. The natives wish to arrest that invasion of Western ideas which brings with it the legalization of what to them are sins. The Government merely wishes to save those who are not fit to take opium from taking it. It is scarcely possible to suppose that the invasion of Western ideas will be at all checked by the action of the Government, and it may even be said that the persistence of the Government in offering the natives opium under conditions that will lessen the evils of its abuse is itself a fresh step towards that dissolution of the ancient fabric of Eastern society which, when completed, will be one of the most momentous changes that mankind has ever witnessed.

DESERTION.

LORD GALLOWAY has good reason for saying that desertion is a subject that no one seems inclined to take up. The existence of this steady drain on the small nominal strength of the army is not denied. The means by which it may be checked are pretty well known; indeed, the COMMANDER-IN-CHIEF seldom makes a speech without mentioning one or both of them. Still the subject is not "taken up." Lord GALLOWAY will perhaps ask how he can take it up more energetically than he does, and it is not easy to answer the question. The conditions which make a subject pressing as well as important are hard to specify, and, until they exist, the most energetic apostle will commonly find that he is preaching to deaf ears. The only comfort that can be given him is that his seemingly neglected sermons may be among the causes which will one day bring the subject to the front. Lord MORLEY contended that there is no foundation for the connexion which Lord GALLOWAY wished to set up between desertion and short service. The fault of Lord GALLOWAY's argument was that in seeking for the explanation of desertion it went too far afield. There will always be, as the Duke of CAMBRIDGE said, a certain percentage of men who, after they have joined the army, will find that they do not like it. As soon as this discovery has been made, one inducement to desertion will come into play. Whether a man will resist it or yield to it will depend on his character, his temperament, and on his calculation of his chance of being able to desert without being brought back. If he has no sense of military obligation, is willing to run a good deal of risk to get what he wants, and has noticed that very few of those who have deserted from the same regiment have troubled the military authorities again, he will probably be off on the first opportunity. There is another motive, however, which seems to be more operative still. To a considerable number of recruits the process of receiving and spending the bounty is so agreeable that, as soon as it is over, they are anxious to begin it again. A great proportion of the desertions from the army, the Duke of CAMBRIDGE states, is owing to the same men repeatedly deserting. It frequently happens that one man will desert half-a-dozen times, and one hero had deserted eight times in the course of his military career. Neither of these forms of desertion is, perhaps, specially associated with the short service or the linked battalion system. In tracing them to these causes Lord GALLOWAY may be thought to overlook the causes that lie at his feet—dislike of the service and a wish to make money without working for it. But, if Lord GALLOWAY did not handle the subject in the most effective way, he

deserves praise for handling it at all. It is true, no doubt, that the question is not one which can be discussed to much purpose in Parliament. But frequent discussions in Parliament help to keep a question before the minds of those who have to deal with it, and in this way the little debate of Monday may be of more use than appears. We do not mean, of course, that the military authorities are indifferent to the evil of desertion. But they know that the real remedies for it are not popular, and unless the subject is occasionally forced upon them from outside, they may not unnaturally be tempted to give the question up as hopeless.

Repeated desertion would be more easily checked than desertion for the first time. All that is needed to put an end to it is that each recruit shall be marked on joining in a way that it shall not be possible to efface. If a man who had once been a soldier could be known as a soldier for the rest of his life fraudulent re-enlistment would be at an end. It used to be thought that vaccination, if performed in a particular way, left a mark which could always be recognized; but, according to Lord MORLEY, out of every 100 recruits who were revaccinated in 1879, only 38 were permanently marked. "To mark the men in any other way" would be likely to excite prejudice, and so to cause a diminution in the number of the recruits. Some people might like to know upon what evidence Lord MORLEY rests his belief that the marking of recruits would excite prejudice. Why, it might be asked, should a man dislike wearing the QUEEN's mark on his arm when he does not dislike wearing the QUEEN's coat on his back? It is plain enough that the man who proposes to make a trade of desertion would dislike it, and in this way the marking of recruits would probably tend to lessen their numbers. But a loss of this kind might conceivably be a gain. A recruit is wanted for service, not as a means of stimulating the secretion of bounties. It may be contended that the strongest reason why a well-disposed recruit should dislike being permanently marked as a soldier would be his thinking that the fact would tell against him after he had left the army. If there is any foundation for this fear, it either points to the existence of serious defects in military discipline, or it is merely a survival from a time when to be a soldier was taken as a pretty fair indication that a man was not steady enough to be anything else. Lingering prejudices of this kind are not to be got rid of by humouring them. If there is any reason to think that they are something more than prejudices, and that the army is a bad school for civil life, additional pains ought to be taken to make it a better school. At all events, the objection to marking recruits is one that may have to be faced. Why should a man dislike being known for the remainder of his life to have served the QUEEN? It is conceivable that if only privates were marked the practice might be objected to. A man who has become prosperous might perhaps not care to have it known that he was once a private soldier. But, it may be rejoined, if officers and privates were marked alike, the existence of the mark would tell nothing as to the rank in the army which a man had held. It would simply indicate that he had served the QUEEN in the capacity of a soldier.

As regards the other cause of desertion, the dislike which a recruit finds that he feels to the service, the only thing that can remove it is to make the life of a soldier more attractive. Men do not usually abandon trades which are either pleasant or profitable, and in an army recruited by voluntary enlistment, recruits will be gained and kept in proportion as the service satisfies one or both of these conditions. The ideal perfection of an army such as ours would be that membership of it should be an object of brisk competition; and the least we can do is to make membership of it a rather better thing than is ordinarily open to men who are not skilled workmen. Here the question of money comes in. We lose recruits for the same reason which makes it difficult to get them—the reason that the army does not seem to them worth entering or worth staying in. When a man is free to enlist or not as he chooses, he naturally sets to work to consider the prospects which enlistment and non-enlistment severally hold out to him. He weighs the wages and the food which he will get as a soldier against the wages and the food which he may hope to get in such other capacities as may be open to him. No doubt this process is not always gone through consciously. But when a man is about to take up an employment which he will be bound to follow for some years, it is almost always gone through

unconsciously. As regards the immediate advantages held out, the army has no cause, probably, to fear comparison with other trades. But there is this serious drawback to it, that it has ordinarily to be given up in the prime of life, and that when it is given up, a means of livelihood has again to be looked for, and to be looked for under less favourable circumstances than those in which the search was first made. A discharged soldier is not unlikely to find the ordinary avenues to employment closed against him. His old companions have found work years before, and have already gained the expertness which makes them worth employing. If he wishes to enter himself for the race upon anything like equal terms, he must be willing to take the work and the wages which he would have taken at eighteen. The remedy for this state of things is to be looked for partly in deferred pay, which may counterbalance, at least in the imagination of the recruit, this inability to work as well as other men of the same age, and still more in the removal of the inability itself. There seems but little reason why every soldier should not be taught another trade than that of fighting. He cannot be always in the drill-ground; and it is a common complaint of commanding officers that they do not know how to keep him out of mischief when he is not in the drill-ground. If some of the time which it is found so difficult to dispose of harmlessly were disposed of usefully, a soldier might find himself at the end of his time with the colours a fairly good workman at the trade which he proposed to follow in civil life.

THE TELEGRAPH CLERKS.

THE telegraph clerks have been chastened even in the hour of victory. They have found a champion in Mr. O'DONNELL, and it is one of Mr. O'DONNELL's peculiar characteristics that those whom he befriends are always seized with a passionate longing that he had been their enemy instead. Whatever may be the result of the searching questions which he is about to address to the Government, his clients cannot possibly be the better for his aid. The Treasury will look with increased suspicion on an agitation which gives telegraph clerks such very strange associates; and, when the Treasury gives its mind to a conflict with the subordinate members of the Civil Service, it commonly gets its way. This is to be regretted because, though the attitude of the telegraph clerks is very far from being irreproachable, there is no doubt that in several respects they have been hardly used. Mr. FAWCETT avows as much in his letter of the 13th of June. He has satisfied himself that "substantial grievances" exist, and upon all but two of the complaints put forward he is willing to make concessions. A new scale of wages is to be introduced, which will involve an increased immediate charge of 44,000*l.* and an eventual increased charge of 128,000*l.* a year. Overtime is to be more highly paid, especially when it has to be given on Sundays, Christmas-day, or Good Friday. This change will cost the country 15,000*l.* a year additional. Night attendance is to be reduced to seven hours, which will necessitate an increased expenditure of 9,000*l.* a year. Besides these changes, which require the co-operation of the Treasury, Mr. FAWCETT is considering how to give one month's leave in the year to those who now have only three weeks, and three weeks to those who now have only a fortnight. The points upon which he is still at issue with the telegraph clerks are the rate of payment during illness, and the right of telegraphists to be paid on what is known as the PLAYFAIR Scale. Mr. FAWCETT does not propose to increase the present allowance of half-pay during illness, the reason, no doubt, being that in a large staff the possibilities of malingering are so numerous that nothing short of a very material difference between the rate of pay when they are well and when they are ill will keep the health of the clerks at anything like its normal standard. As regards the application of the PLAYFAIR Scale, Mr. FAWCETT and the Treasury alike hold that the telegraph clerks have not a leg to stand on. Many thousands of persons, says Lord FREDERICK CAVENDISH, who are equally with these telegraphists officers and clerks in the Permanent Civil Service of the Crown, receive less than they would receive under the PLAYFAIR Scale; and there is no apparent reason why the complaining clerks should take the PLAYFAIR rather than any other scale as an index to what justice would give them.

In their answer to Mr. FAWCETT the Treasury, while consenting to all his specific proposals, proceed to read the clerks a severe lecture upon the offence they have been guilty of in trying to better their condition by agitation. It is this part of the letter that has so shocked and so startled Mr. O'DONNELL. "My Lords" are "not prepared to acquiesce in any organized agitation which openly seeks to bring its extensive voting power to bear on the House of Commons against the Executive Government responsible for conducting in detail the administration of the country." If Mr. O'DONNELL will allow us to say so without essaying to bring us to the Bar of the House of Commons, the Treasury are only using the language of strict common sense. It is impossible to argue a question of this sort without some regard to consequences. Mr. O'DONNELL contends that the Treasury, or, as he prefers to put it, "a Secretary to the Treasury," is seeking to deprive the telegraph clerks of the common constitutional right of appealing to Parliament for the redress of grievances. He forgets that the grievance of which these clerks complain is one of a kind with which the Legislature does not ordinarily concern itself. Why should Parliament interfere between employer and employed merely because the employer happens to be the Government? The telegraph clerks are not compelled to sell their services for less than they think them worth; they are free to give the customary notice and to go about their business. The Executive Government may properly consider with itself whether the pay is good enough to attract the right kind of clerks or to make those it does attract sufficiently contented to do their work well. But this is simply the kind of attention which any prudent private merchant would give to the demands of his clerks; and the fact that it is due from the Government to the telegraph clerks does not make the House of Commons a proper Court of Arbitration between employer and employed. If the kind of agitation which the telegraph clerks have sought to set on foot becomes a recognized instrument of raising the wages of Government servants, we shall be confronted by this singular state of things. In all other employments the rate of pay is fixed partly by the supply of labour and partly by the employer's estimate of the nature of the work to be done. In the Government service it will be fixed by the amount of influence which the members of that service can bring to bear on the House of Commons. When the branch of the service which thinks itself aggrieved happens to be well represented in the electorate, its complaints will at once be listened to. Almost every constituency will include some of the clerks, and in some, at least, the balance between parties may be decided by the action of a small body of voters who have agreed to treat politics as subordinate to business. The condition of the labour market would no longer have any meaning where the Government service was concerned. The pay would depend, not on the supply of clerks and the amount of work to be done, but on the degree of pressure which the clerks could bring to bear on the House of Commons. Under any circumstances this would be a formidable prospect. If Parliament were once to betake itself to the task of determining the rate of wages, the length of the working day, and the amount to be paid for overtime, it might not so easily abandon it. The great body of the electorate belongs to the class which live by manual labour, and when they had grown accustomed to the discussion of these questions by their representatives, they might not unnaturally ask why clerks should be more favoured than artisans, and why, if it is right to compel a Government department to pay more than the market price for labour, it should be wrong to compel a private employer to do the same thing. This would be a formidable prospect, we repeat, apart from all considerations as to the source whence the wages in question are to come. But it is all the more so when, as the Treasury point out, the wages are found by the community. The Executive Government is the agent of the taxpayers, and in this capacity its first duty is to take care that their money is spent so as to get good value in return. But the Executive Government must do the bidding of Parliament, and if the voting power of the Civil Service is judiciously used, Parliament may be induced to order that the clerks first in one department and then in another shall be paid higher wages than they would otherwise be in a position to obtain. It may be said that Parliament is also the agent of the taxpayers, and that, if it is not to their interest that Government servants shall be better

paid, Parliament will give no such orders. It is constantly found, however, that a small but organized body, which knows what it wants, and is greatly concerned to obtain it, has an immense advantage over an inert and indifferent mass. No individual taxpayer is appreciably the worse for any particular increase of pay in a Government department. He is the poorer for such increases in the aggregate; but then they are not proposed in the aggregate. The only chance, therefore, of saving him from what in the end will be a serious burden is to take the line which the Treasury have taken with the telegraph clerks, and to make a resort to organized agitation a barrier to any improvement in pay. It is the more important to do this in the present case, inasmuch as the telegraph clerks have tried to combine two inconsistent methods of action. In the character of Government servants they have pressed Parliament to take up their cause; in the character of labourers having their labour to dispose of, and being free to sell or to refuse to sell it, they have threatened to strike work. If they are members of a service, they have no right so long as they remain in it to refuse to abide by its rules. If they are ordinary workmen, they have no right to ask Parliament to interfere on their behalf.

FATHER CURCI'S NEW BOOK.

IT would surprise nobody to learn that Father Curci's recently-published work, *The New Italy and the Old Zealots*—like his *Modern Dissension between Church and State* issued four years ago—has already been placed on the *Index Expurgatorius*, within a few weeks of its appearance, even if the Roman telegrams for some days past had not contained repeated intimations of its approaching fate. Whatever reverence may be professed by orthodox, or at least ultramontane, Roman Catholics for the decisions of the august tribunal charged with drawing up the *Index*, neither its origin nor its method of procedure is such as to inspire any confidence in—we do not say the infallibility, for it does not even claim to be infallible—but in the soundness or honesty of its judgments. Instituted about the time of Alexander VI., more for the purpose of screening the scandals of a Court exceptionally scandalous than for maintaining the purity of faith or morals, it has applied a hundred other tests besides that of heresy, even in the strictest Tridentine sense of the term, to the works which have incurred its censure. On the other hand, the gross immoralities of Boccaccio's *Decameron* were easily condoned, on condition they should no longer be attributed to monks and nuns. Some ten years ago there was published a curious pamphlet, noticed at the time in our columns, giving an account of the treatment which the author had experienced at the hands of this singular tribunal, and the impression left on the reader's mind was certainly not one very creditable to those concerned. But perhaps the strangest illustration in recent times of the casual and crooked methods of procedure by which obnoxious works are brought under the lash of this mysterious Congregation of the Index—which judges secretly without allowing the author opportunity of explanation or appeal—was afforded at the beginning of the reign of Pius IX., when a book published not only with the sanction but by the express direction of the Pontiff himself was shortly afterwards placed on the *Index*, while its author was publicly disgraced by the authority of the same Pope. Rosmini's *Cinque Piaghe della Santa Chiesa*, exposing various practical corruptions of the Church in Italy, appeared to Pius IX., to whom the author had submitted it in manuscript in his early reforming days, so useful and excellent a work that he ordered it to be printed at the Papal press at Perugia. Rosmini was far the most distinguished Italian ecclesiastic of this century, was an intimate friend of Gioberti and Manzoni, the founder of a new Order, and a voluminous writer on theological and philosophical subjects; the Pope had formally intimated to him his promulgation as Cardinal, and this work of his, which deals trenchantly enough with several practical abuses in the Church, created a far greater sensation at the time than anything Father Curci has published. But at the critical moment came the Revolution of 1848, the flight to Gaeta, and the forcible restoration of the Temporal Power and of Austrian rule in Italy. Rosmini was a Piedmontese, and therefore an Austrian subject, and was odious as a Liberal ecclesiastic alike to the Jesuits and to his own Government, who demanded the censure of the book and the exclusion of the author from the Sacred College. The Pope, who had been rudely awakened from his Liberal dream, and was thoroughly frightened, yielded—we may hope not without some reluctance—to both demands. The *Cinque Piaghe* was placed on the *Index*, and by an unprecedented interposition at the last moment, which virtually inflicted a public stigma upon him, Rosmini, who had actually purchased his scarlet robes in readiness for the State investiture, was struck off the roll of Cardinals. Father Curci, who has received much private encouragement from Leo XIII., is a less conspicuous victim. But he may console himself with the reflection that, if his new work is placed on the *Index* by a decree which has received Papal sanction, that does not at all prove that the present Pope may not agree with him. He has indeed him-

self, as we shall presently see, supplied a plausible and probably correct explanation of the conduct of the Pope in the matter, and can afford to smile at the verdict pronounced on him by the *Tablet*, as "a noisy, turbid, and restless spirit in the field of religion, who does not properly know his own mind." It is true, we believe, as the same writer goes on to observe, that he was some years ago the leading editor of the *Civiltà Cattolica*—the Jesuit ultramontane organ specially authorized by the late Pope—but if "in 1876 he founded the *Voce della Verità*," it can hardly have been in order to "advocate the restoration of the temporal power." For in the following year only he published the work already mentioned, which openly denounces the temporal power, and had before that, and while still a Jesuit preacher, advocated in the pulpit and the press what the *Tablet* charges on him as a novel discovery now, "that all Catholics should recognize the finger of God in the dethronement of Pius IX., and believe that it was brought about by Divine Providence for the good of religion." The publication of the *Modern Dissension*, written while he was a Jesuit, led to his expulsion from the Order. And here it is worth noting that the two Italian priests who have come forward to condemn the temporal power—Passaglia and Curci—both spent the greater part of their lives as Jesuits, and are the two most illustrious members of that Society in Italy during the present century.

It is natural, of course, that ordinary Italian readers should regard Curci's new work chiefly in its immediate bearing on political questions of the day; and we find it noticed accordingly in connexion with the Election Reform Bill by the Roman journals. Thus the *Opinione*, for instance, fully endorses the author's view that the Clericals should go to the poll and throw themselves generally into the public life of their country, partly in the hope that their doing so would tend to reunite the broken ranks of the Liberals in opposition to a common foe. On the other hand, one of the bitterest complaints of his ultramontane assailants is that Curci argues for the immediate participation of Catholics in parliamentary elections without waiting for permission from the Pope. But they must be themselves aware that it is very generally suspected, to say the least, that Leo XIII. is personally in favour of such a course, though he may, as Curci intimates, feel obliged, in this as in other and still graver matters, to surrender his own judgment to the urgency of the unwise counsellors who surround him. The following passage, in which Curci sketches the attitude of the Pope from his own point of view, accords closely with the estimate we had ourselves formed from the first, and which is constantly receiving fresh confirmation from the most various quarters. It should be remembered, too, that within a few months of the accession of Leo XIII. Father Curci, with his condemned work just fresh from the press, and while expressly declining to retract or disavow it, was invited to the Vatican, where he spent about a week in constant intercourse with Cardinal Pecci, the Pope's brother, who was an old friend of his, having, as was believed, several private interviews with the Pope himself, as well as with Cardinal Franchi, then Secretary of State. It would of course have been impossible for him in a published work to make any distinct mention of this confidential intercourse, but it is hardly needful to read between the lines to discern in the guarded references to what he is "told" by intimate friends of Leo XIII., what he "has good reason to believe," and the like, the echoes of information derived from a still higher source. And it is specially noteworthy that he emphasizes a point more than once dwelt upon in our columns, viz., that his too strict fidelity to constitutional principles of government, in the teeth of all precedents of the last reign, is what mainly hampers the Pope in any attempts at practical reform. Leo XIII. has always loyally adhered to the declaration made soon after his election, that he would govern the Church, according to ancient custom, in concert with the Cardinals who are the proper advisers of the Pontiff. The principle may be an excellent one, and after the arbitrary vagaries of the previous thirty years there seemed to be an obvious reason for putting it on record in this public manner. But when it is remembered that the College of Cardinals has been filled up twice over by Pius IX. during a pontificate of unprecedented length with creatures of his own—this application of the term to the Cardinals created by a particular Pope is a recognized one—the enormous difficulty of securing the sanction of such a body for any effectual reforms, and especially for reforms which may touch its own dignity and prerogatives, becomes manifest at once. With these preliminary comments our readers will be at no loss to appreciate the full significance of the following description of Leo XIII. in Father Curci's book:—

From what he wrote when in a humbler station, from his public acts in his present high one, from what I am told by most worthy personages who know him intimately, Leo XIII. in many respects, and not of the best, forms a marked contrast to his predecessor. He ponders well before resolving, does not act by caprice, as Pius IX. often did, and defers to the opinion of the majority to the point of sacrificing his own inspirations. This pliable disposition rendered him the prey of the atmosphere impregnated with adulation and fanaticism created at the Vatican by Pius IX. On receiving for the first time the Sacred College of Cardinals, he expressed his intention to govern the Church according to ancient custom, setting due store by their counsels, not perceiving that the system of abuses introduced arbitrarily and strengthened by time could only be eradicated as arbitrarily. The evil effects of this noble defence showed themselves in his first Encyclical as Cardinal Bishop of Perugia. Whilst deploring the great evils which mar modern civilization, he recognized its good elements, and thought the best remedy for the former was to encourage the latter. Nor does he appear to have changed his mind. He is determined to sanction no usurpation against the Church, maintaining her sacred immortal rights in the sphere of justice; but

practically he cannot but wish all good to New Italy, and chiefly the cessation of the strife which has now lasted twenty years between Church and State, the source of inestimable evils to both. I have good reason to believe he had not only harboured but elaborated these views, intending to set them forth in his first Encyclical. This felicitous and sacred inspiration, which would have given peace to Italy and a new impulse to her religious life, remained without effect for the above reasons.

In another part of the volume Father Curci dwells, as Rosmini had done before him in the *Cinque Pagine*, on the decline of theological and Biblical studies among the clergy. He also advocates, like Rosmini, a revival in some form of the primitive method of electing Bishops by the clergy and people of the diocese; and this partly as a check on the vicious system of centralization which has been gaining ground in the Church, whereby "the bishops, who are set by the Holy Ghost to rule over the Church of God, are reduced to mere lifeless instruments, and all their vitality is absorbed in the supreme head." There is nothing, it is argued, heretical or savouring of heresy in insisting on the need for reform. How should it be so, when the great Council of Constance grew out of a long accumulating demand for "the reform of the Church in her head and in her members," and from that time forward Councils and Popes and Cardinals—notably the Council of Trent—have laboured to effect salutary reforms? Within living memory Cardinal Sala published a work on reform, which was indeed condemned and suppressed by the Curia, but not till it had been greedily devoured by the present Pope, then a student in the Ecclesiastical Academy, to whom the author had shown it in manuscript. Two chapters of the book are devoted to that final separation of Church and State, which Curci regards as the future designed for the Church by Divine Providence, and for which she ought to prepare herself beforehand. There is nothing, he thinks, in modern democracy alien to her true character, inasmuch as her Divine Founder dwelt among the people, holding aloof from the kings and great ones of the earth, and always showed Himself austere towards the rich. As to the fate of Church property Father Curci appears to be very indifferent, viewing it rather as a hindrance than a help to the spiritual work of the Church, and he appeals to his own experience, as for fifty years a member of a Religious Order under vows of poverty. But on this it might be observed that the Jesuit Order, to which he belonged, is enormously wealthy, though its individual members have nothing they can call their own; nor is it by any means clear that a Church without any endowments would be less obnoxious to his righteous warning against "the ministers of Christ paying court to rich men, still more rich women, for their money, and thus incurring the rebuke addressed by Him to the Pharisees who devoured widows' houses." There is a touching force and pathos in the concluding chapters of this little volume—which, like the author's last brochure, comprises only about 250 pages—where he narrates the trials he has himself undergone at the hands of the "zealots," against whose views it is directed, and who are still so powerful that none of the clergy who share his views dare openly avow what they think. One of the revisers of the proof sheets, he says, erased a passage mentioning merely the name of the town he lived in, not his own, with the marginal note, "Useless and compromising." The clergy, even under such a pontiff as Leo XIII., like the Pope himself, are heavily handicapped, but the laity at least are free, if they choose to call their souls their own. And Father Curci accordingly closes with an eloquent appeal to the Catholics of Italy to shake off this incubus, and devote themselves heart and soul for the service at once of their country and of their Church. He is an old man and has been sorely tried; whether he will live to see the fruit of his labours it is impossible to say. But there can be little doubt that the earnest testimony of men like Dollinger and Rosmini and Curci and Passaglia, who have indeed "learnt in sorrow" what they teach, not exactly in song but in weighty words of protest and admonition, will sooner or later exert an appreciable influence over the future of their Church.

A CONGRESS OF DOMESTIC ECONOMISTS.

IF the world could be saved by the multitude of Congresses, no period would seem more hopeful than the present. The friends of social science, not content with their usual performances in autumn, are having a kind of by-day at the Albert Hall. Here ladies, a few clergymen, and Sir Henry Cole discuss the best manner of teaching the orphan girl to sew and to cook potatoes. The proceedings are recorded by a reporter in the *Daily News*, who, we regret to say, does not seem quite in sympathy with the meeting, and writes, so to speak, "with a horrid worldly laugh." That the condition of the lower, middle, and professional classes in this country is squalid, miserable, shiftless, mirthless, and disorganized we know, not only from experience and observation, but from the repeated complaints of Mr. Matthew Arnold. We are ill dressed, ill fed, ill looked after in every way; our houses are unswept, and, when garrisoned, they are garrisoned in bad taste; while the plumber, as soon as he has gone forth, returns with seven other plumbers worse than himself. We do not know how to enjoy ourselves. Our earnest working-men find that their partners, like the man in the old song, "can eat but little meat," and care still less to take trouble in cooking it, while they "can drink with any he that ever wore a hood." The police reports are full of the hideous cruelties inflicted by drunken and disappointed husbands on wives ignorant and reckless of domestic economy. The whole

prospect is so miserable that one must either weep or laugh at it, and the worst of it is that the Congress of Domestic Economists seems to have no remedy for the national distress. The suggestions in the papers read are contradictory. All sorts of schemes of teaching and inspection are spoken of and rejected. Sir Henry Cole says that the Education Department "has so far yielded" to pressure as to spend three millions yearly in doing something, yet that something they had not hitherto learned to do." And, as far as the reports of the Congress go, the Congress seems not likely to instruct them.

By way of showing the general indifference to the momentous topics discussed by the Congress, the Gentlemen of England stayed away from the first meeting. Only half a dozen of them were present. A gloom was then thrown over the meeting by the handwriting of Lady Stuart Hogg, who had prepared a paper "describing in dark colours the ignorance of our working people in matters of domestic economy." But, as Lady Stuart Hogg was not present, one of the six gentlemen, Mr. Newton Price, tried, pluckily, but without any marked success, to read her essay aloud. This he did, "as well as he could decipher the MS." The misery of hearing a gloomy paper read aloud in fragments, with stops in the middle of clauses, and with conjectural emendations by the reader, may readily be imagined. The paper advised "making compulsory the teaching in State schools of all subjects of practical utility." Writing, we believe, is already taught in State schools. When this paper had been deciphered, with almost the same success that attended the early readings of Babylonian cylinders, "Sir H. Cole tried his best, but in vain, to induce the ladies to get up a discussion." But the argumentative element in the character of the ladies present was damped for the moment, and Sir H. Cole in vain threw the apple of controversial discord into the midst of the assembly. He trailed his coat, if we may say so, but no lady would oblige him by treading on the tail of it. Then various people advised systems of inspection to be managed by South Kensington, because White Hall is still in a state of economic darkness. Mrs. Cooper pointed out that hundreds of working-girls are eager to learn domestic economy, but have no one to teach them. The fact is, that to teach housekeeping you need to have a house. Some one drew on a black-board a spirited sketch of sweeping a room. But a few hours with a broom are worth a wilderness of black-boards. Take the case of a working-man's family, with three or four big girls already employed in manufactories, three or four brothers equally busy, and two or three little girls, whose energies are overtaxed by the baby of the moment. All the members of the family have their own independent habits, hours, and income. All meals are moveable feasts. The mother is probably an exhausted person, who "lets things slide," and occasionally makes impetuous but unsuccessful forays against the dirt and disorder. How are girls in this class to learn housekeeping and domestic economy? Women are notoriously indifferent to their food. If a European community could be deserted, for a year, by the men, we verily believe that the women would slide back, first into a custom of having tea and a chop at every meal, next into pecking at some bread and butter at any hour when they felt the pangs of hunger, lastly into the condition of savages who live on casual roots and the gum and bark of trees. It is man, proud man, who keeps woman up to the civilized mark in the matter of eating and drinking. Now woman, in the poorer classes, has so many calls on her time and attention, and man is so much absent from home, that cookery has become a lost art. It is not so in France, of course, and we only wish it were so in Germany, where the existing school of cookery is destitute of a pure ideal, and rests on a greasy and rapacious empiricism. Our populace and our Philistines must have more civilized conceptions of life before they can learn to cook, and they must learn to cook before they can understand the enjoyment of life. We are involved in a vicious circle. More space, more air, less dirt, less work, less worry are needed for the well-being of both sexes. But our private and mournful impression is that people will never have the leisure to be happy, to keep decent houses, and to dress and dine like human beings, till the commercial prosperity of England has vanished quite away like her warlike supremacy; till we are a small, contented, pastoral people, without an empire, or commerce, or manufactures, or anything but our native fields and the population they will suffice to support. Then people will have leisure to enjoy themselves, and all the world will not be working like slaves to put money in the pockets of Sir Gorgias Midas. If this view seem cynical, or illiberal, it has, at all events, the support of Mr. Mill's authority, for that Radical and economist saw nothing but human misery in the multiplication of money and manufactures. He looked forward to a stationary time, when wealth should reach its limits, all markets be glutted, and no nation compelled to make haste at the expense of leisure and the decencies of life. But these long views, in which alone we see much hope for the future of popular domestic economy, must not longer detain us from recording the performances of the Domestic Economists.

Miss Andrews, a Guardian of St. Pancras, thought children were taught habits of waste in the workhouse. We had imagined that it was otherwise, and that an almost overstrained economy made it useless for Oliver "to ask for more." But the process of "pampering parochial paupers," though elsewhere unknown, may be familiar in the parish of St. Pancras. It is an awful charge that "pauper children are indoctrinated into habits of waste," and learn

to turn up their little noses (as we suppose they do) at wholesome hashed mutton. Somewhat *à propos des bottles*, Sir Henry Cole, seeing Lady Stanley of Alderley in the room, asked her "whether she was of opinion that a child of three years old might be taught habits of domestic economy." Sir Henry Cole was apparently "blue-moulded," like the Irishman, for want of a discussion. He had become reckless, and capable of putting Boswell's famous question, and asking Lady Stanley what she would do if she were shut up with a baby in a tower. Lady Stanley of Alderley expressed an opinion that children of three might safely be left in ignorance of domestic economy, and that four years of age was early enough for tuition in this science. In the dark ages of the past, few children read Miss Edgeworth's *Waste not, want not*, before they were six. The lesson of that economic treatise is that string is a rare substance, which can only be obtained from the outside of equal parcels, and that you should never cut the string of a parcel, but untie the knot and put the cord in your pocket. We can imagine no lesson in domestic economy which appeals more forcibly to childhood, and we are still unable to resist the temptation offered to the thrifty soul by a good long piece of string, without too many knots in it. Another manual of domestic economy for the young to which we would earnestly call the attention of Sir H. Cole is the didactic poem of "Struwwelpeter." Children, even of three years of age, will learn to finish their food, and not to waste it by neglecting to consume it, from the affecting tragedy of Adolphus.

Adolphus was a chubby lad ;

but he neglected his dinner, and a painfully realistic set of illustrations shows Augustus waning away with a rapidity which would surprise American fasters. These things are more to the point than an attack by Mr. Hay Hill on what he called the aristocratic "idiotcies" of fancy fairs. Miss Becker, who is a grim woman, rather crushed the Economists by protesting against the leading proposals of the promoters of the Congress. Make a girl intelligent all round, said Miss Becker, and then she will need no college to teach her how to cook or sew. We doubt this theory of Miss Becker's. Most undergraduates learn a little cooking, being taught of necessity, but we are not sure that the classical pupils of Girton and Somerville Hall can make omelettes by dint of their general cultivation. Shelley was a very intelligent man, but he spoiled the oysters on a celebrated occasion.

Looking at the needs of the opposite sex, many ladies declared that boys should be taught knitting. Lady Airlie's coachman, the Congress was informed, knits all the stockings for his family. There was once a man at Cambridge who did crewel-work. Here are two historical examples for the imitation of youth. Passing from this topic to that of the dress of servants and teachers, the ladies began to discuss with a spirit which must have made Sir H. Cole feel that he was not without his reward. A shocking incident, the appearance of a teacher in a black velvet dress, was commented upon with emotion. Why do Economists always rank velvet and lace among the deadly sins? These commodities point the moral in all economical books, from the days of Adam Smith to those of Mrs. Fawcett. The Congress next reverted to what a lady sweetly called "the culinary preparation of food." An affecting anecdote was told of a lady who wept on tasting an egg poached by her own daughter. Perhaps this lady knew that there goes wit to the poaching of eggs, and was overcome on recognizing in her daughter a person likely to obtain ennuiee as a humourist. But, though we have not actually shed scalding tears over them, the poached eggs of woman, as Wordsworth says of "the gratitude of man," have "often left us mourning" and even resentful. The value of the deliberations of the Congress would, we think, be overstated at the price of one well-poached egg.

"THE ELECTRIC STORAGE OF ENERGY."

SOME few weeks ago a letter appeared in the *Times*, signed "F.R.S.," describing a "box of lightning" which the writer had brought over from Paris for the purpose of submitting it to Sir William Thomson. Since then a long discussion has taken place on the subject of the invention and its usefulness. To begin with, we fully share the regret of Professor Tyndall, who has written a letter on the matter, that so much loose nomenclature has been introduced into the subject. The term "electric storage of energy" appears to us to be singularly unhappy. What is known as a condenser, or a Leyden jar, is truly an instrument for the electric storage of energy, because, when charged, its parts are in a condition of molecular strain, which is recognized as an electrical phenomenon; and the release of this state of strain invariably produces at first some of the phenomena of electricity in motion. But in the case of M. Faure's secondary battery, which is the invention under discussion, although it is charged by a current of electricity and gives out a current of electricity, the form of the store of energy which it contains is not that of electrical stress or strain, but that of chemical separation—a form of potential energy which can be caused, under certain circumstances, to become kinetic energy in the form of heat. However, the term has now become established, and, being convenient, will probably survive. But it is to be hoped that the real state of things will be thoroughly and publicly explained by our leaders of science, so that the use of this form of words may not cause a confusion in scientific ideas.

From the ease with which secondary batteries can be constructed of very low resistance, so that they will give for a short time what practical electricians call a quantity current, they have been for some time in use for certain special purposes, principally for heating the wire of the galvanic écraseur in surgical practice. By a secondary battery is meant a galvanic battery which, as at first put together, has no tendency to give a current at all; but, if a current of electricity be passed through it of sufficient tension to decompose the fluids which it contains, will give a current in the opposite direction, due to the recombination of the separated parts of the decomposed fluid. The older forms consisted of two plates of platinum, preferably coated with spongy platinum immersed in a weak mixture of sulphuric acid and water, the action in this case being that the charging current decomposes the water (either directly or as the result of a chemical action set up by decomposing the acid first) into oxygen and hydrogen, which gases are absorbed by the platinum plates, the oxygen by one and the hydrogen by the other. When the charging battery is removed, the secondary battery will give a powerful current until all the oxygen and hydrogen absorbed by the plates are re-combined in the form of water. It was afterwards found that satisfactory results could be got from plates of lead treated in the same way. Their employment, of course, reduced the first cost of the apparatus. M. Planté then produced his secondary battery, in which he obtained great surface, and consequently low internal resistance, and large current, by rolling into a spiral form two lead plates separated by pieces of insulating material placed between them at intervals. He further succeeded in greatly increasing the time for which the battery would give a given current, or its capacity, by adopting an elaborate process for the "formation" of the plates, which consisted of charging the battery and discharging it, varying the direction of the exciting current, and leaving the battery undisturbed between the charging and discharging for gradually increasing intervals of time. This process added enormously to the expense of the apparatus, which was also too bulky and heavy.

M. Faure, however, has succeeded in increasing the capacity of the battery, and getting rid of the long and delicate process of formation. His battery, like M. Planté's, consists of two plates of lead rolled together into a spiral, but he coats each plate with a thin layer of red lead (one of the oxides of that metal), kept in its place by a piece of absorbent felt, which also keeps the two plates from touching. This felt is saturated with the weak acid. The effect of the exciting current in this case is to deposit spongy lead on one plate and to convert the red oxide on the other into puce-coloured oxide which contains more oxygen than the red form; no doubt, also, the spongy lead at a late period of the charging becomes saturated with hydrogen. When the battery is now set in action the spongy lead becomes re-oxidized to red lead and the puce-coloured oxide reduced to the same salt.

Sir William Thomson early in this month wrote to the *Times*, pointing out the great advance which this invention had made in the practical and economical storage of energy. His letter was answered by Professor Osborne Reynolds, who, with the intention of preventing the public from being astonished at the storing of so much energy as one million foot-pounds in apparatus occupying a cubic foot of space and weighing about 72 lbs., proceeded—somewhat irrelevantly as we think—to discuss the energy contained in a pound of coal, and also to complicate the now inevitable controversy by referring to a totally different problem, the transmission of energy by electrical means. The controversy thus started has gone on, Sir William Thomson, Professor Osborne Reynolds, Professor Ayrton, and Professor Tyndall taking part in it.

The question, as far as the public are concerned, is a purely commercial one. As yet, of course, the data of the cost of the battery and its durability are not yet ascertained; but, in any future discussion on the subject, the question of convenience, as well as that of absolute expense, will have to be taken into consideration. At present we know that at some expense, probably not too great, we can utilize a source of energy of feeble power for many purposes by allowing it to act for a long time, collecting its energy, and using it quickly, and that the loss in the process will be but small; and that, further, if it be desired to use the electric light temporarily, it can be produced conveniently, if not economically, by the use of M. Faure's invention. Sir William Thomson in his first letter points out many practical uses for the new invention; we may supplement them by pointing out how the new secondary battery may be applied conveniently for many purposes. Three ordinary Daniell's cells will charge an element of the new battery easily, so that if there be plenty of time for preparation, we can, by the aid of Faure's batteries, use this cleanly apparatus, which gives off no noxious fumes and needs but little attention, for all the purposes for which up to the present time we were obliged to employ the costly and troublesome Grove's or Bunsen's batteries, which contain violent caustic poisons, and give off irritating and unwholesome fumes.

The whole discussion about the mechanical value of coal seems to us mistaken; neither Sir William Thomson nor any other physicist proposes to use the new battery universally, and at present our cheapest way of charging it is by the use of a dynamo-electric machine, driven by a steam or gas engine—i.e. by making use of the mechanical power of coal and the oxygen of the air; setting aside, of course, the exceptional cases where water power is to be obtained. Sir William Thomson himself gave, we think, the *coup de grâce* to any attempt at comparing the

relative values of transmitting electric currents through conductors from the source of energy to a distant station where energy is wanted, and conveying energy by exciting Faure's batteries at the one place and conveying them to another, when he wrote in one of his letters of "Professor Reynolds's disappointment with M. Faure's practical realization of electric storage, because it does not provide a method of *portage* superior to conduction through a wire." This is "like being disappointed with an invention of improvements in water-cans and water-reservoirs because the best that can be done in the way of moveable water-cans and fixed water-reservoirs will never let the water-carrier supersede water-pipes wherever water-pipes can be laid." If we may venture to extend the great electrician's metaphor, it is like finding fault with the Great Eastern Railway Company's service of sea-water brought to London in cans, on the ground that it is just possible to obtain sea-water by a large main laid down to the coast, and that such a scheme is now under consideration. Another valuable property of the new battery is pointed out by Sir William Thomson. If it were to be used either at a fixed station to work an electric railway, such as the firm of Siemens have already brought into practical use, or to be carried on an ordinary carriage to drive it—the energy developed by the vehicle in running downhill would be stored up ready to be used for its propulsion when it again reached a level or an ascending incline.

In the course of the correspondence Professor Ayrton has again mentioned the experiments which he and Professor Perry are carrying out with the view of using coal or coal gas instead of zinc in a primary battery. Should he succeed in doing so, we should obtain a source of energy about ten times cheaper in working than the best known steam-engine, and M. Faure's invention may very likely be the means of making it a commercial success; for should Messrs. Ayrton and Perry or any other physicist succeed in making a coal or coal-gas battery giving a good proportion of the theoretical energy of the coal or gas, should it have a high internal resistance, it would be difficult to use it in practice; but by the aid of Faure's batteries, in cases where work was only wanted to be done for a few hours a day, as in the case of electric lighting, the comparatively feeble current of the primary battery might be collected and stored for fifteen or sixteen hours, and then allowed to run out again in the eight or nine hours for which the source of energy is practically wanted.

The subject of this new secondary battery is one of great scientific importance. As the writer of a leader in the *Times* points out, it is by no means unlikely that a similar piece of apparatus may be made of some metal, and its appropriate salt, which shall be cheaper and lighter than one of M. Faure's form of similar powers; at all events, the invention and its results are pretty sure to turn the attention of inventors and investigators towards batteries both secondary and primary—a branch of inquiry which has for so many years been quite thrown aside in favour of endeavours to improve the dynamo-machine. Now a primary battery is theoretically the most economical artificial source of energy, and it is only the comparatively high cost of the fuel generally used in these—zinc—which prevents them from being practically useful. A galvanic battery gives out very nearly the whole energy due to the chemical combinations which take place in it; so that it is hardly too much to say that, were a battery to be employed to drive an electro-motor, under suitable conditions, we could obtain at least 60 per cent. of the chemical energy, whilst the best known steam-engine will only give about 10 per cent. of the chemical energy of the coal and air consumed in its furnace. There is thus a large margin for first cost of the substance to be consumed in the battery.

THE LINCOLN ARCHITECTURAL SOCIETY AT SLEAFORD.

THE Architectural Society of the diocese of Lincoln has just held a pleasant and successful meeting. Sleaford, the central place from which the excursions branched, is a bright attractive little town, thoroughly *bourgeois*, but enviably comfortable in its *bourgeoisie*. Here and there an arched doorway, or a stone-mullioned oriel, or heraldic escutcheon tells us of the antiquity of the town, but its general aspect is modern, yet not too modern to be interesting. The scale and mass of the church—deservedly celebrated as one of the noblest of the many noble Lincolnshire churches—is sufficient to dominate and give character to the whole town, and to impart a very striking aspect to the wide well-built market-place, terminated by its singularly ornate, though somewhat confused, west front, carrying more architecture than it comfortably bears. The names of the four streets diverging from the market-place—Northgate, Southgate, Eastgate, and Westgate—have a medieval sound, with which their general character is fairly in keeping. Considerable dignity is given to the south entrance of the town by a tall, well-designed memorial cross, rising in a lofty spirelet from a canopied upper story. The lower story, enshrining the statue of Mr. Handley, formerly M.P. for South Lincolnshire, is less happy.

The historical memories of Sleaford, though slender, are sufficiently interesting. Like most of our old English towns, it has been from time to time visited by historical personages, and witnessed historical events. Given under its denomination of "Ectaforde" by the grateful Conqueror to Remigius, the first Norman prelate of the Great Bishopric of Mid-England, the manor with the castle subsequently erected upon it by Bishop Alexander

"the magnificent," though every now and then taken into the King's hand when the loyalty of its episcopal lord appeared suspicious, remained in possession of the See of Lincoln until the miserable Bishop Rands of Holbeach, the great despoiler of the bishopric, obsequiously alienated it "for a personal consideration" to Protector Somerset when glutting his greed with the last spoils of the impoverished Church. From Lord Clinton, to whom, after the attainder of Somerset, it had been granted by Queen Mary as a reward for his share in suppressing Wyatt's rebellion, the manor and castle were bought by "old Robert Carr," one of a Northumbrian family, from Hetton, in Glendale, whose name is conspicuous at Neville's Cross, Tewkesbury, Flodden Field, and other great historical battles. This "proper gentleman," as Leland terms him, born in the old religion, nephew to the Prioress of Brinkburne, was, we are told, "a close observer of the Reformation," with an especial view to the purchase, on easy terms, of the monastic property, which the Crown had taken to itself. He had also a sharp eye for property forfeited by attainder, much of which, having the ear of the sovereign, he secured on very easy terms. Among these were the estates of his fellow-townsmen, Lord Hussey, of the Old Place, some remains of which are still to be seen at the north end of the town. Old Place is described by Leland as the great ornament of the town; but after being garrisoned and fortified by the Parliamentary troops under Cromwell in 1644, it was burnt to the ground by them on their departure. It was from this house that, two months after the battle of Marston Moor, September 6 of that year, the future Lord Protector, then only a Lieutenant-Colonel, wrote to his old neighbour, Colonel Valentine Walton, lamenting his inability to hasten to the relief of Essex and his forces in the Western counties. In the great religious insurrection in Lincolnshire for the maintenance of the old faith and the restoration of the monasteries under the Abbot of Barlings and the so-called Captain Cobbler in 1536, Hussey, unwilling to join the rebels, equally unwilling to oppose them, and, at last, fairly running away when the insurgents threatened to bring him by force into their camp, was finally compromised by the action of his wife in sending provisions to the Lincoln forces; and in spite of his assertion that he "was never traitor nor of none counsel of treason against his Grace," was tried by his peers, found guilty, and executed in front of John of Gaunt's Palace in the High Street of Lincoln. The tale that Carr betrayed his old friend and received his estates as the price of his perfidy is probably a slander. It is at variance with the fact that they became his, not by grant, but by sale. By these discreet purchases and "by the death of three rich wives"—two of them very well-dowered widows—Carr became one of the wealthiest and, for a commoner, one of the largest territorial owners in the kingdom. He survived to aid Queen Elizabeth with a loan in her preparations against the Spanish Armada in 1588, and died at an advanced age two years afterwards, September 11, 1590. He lies buried with his three wives under an altar tomb at the north angle of the chancel arch in the parish church. At the opposite angle is another much more elaborate Corinthian monument, supporting the alabaster effigy of Sir Edward Carr, Robert Carr's fourth son, who was eventually his heir, and his second wife. Both are much mutilated, probably by some of the various parties of soldiers who at different times, both in the Great Rebellion and subsequently in the Revolution of 1688, were quartered in the sacred edifice. The last male heir of the Carrs, Sir Edward, whose well-executed bust, in a full flowing periwig, stands under the great north transept window, died in his nineteenth year, twelve months after his father, and the estates then passed to his sister Isabella, who married John Hervey, Esq., of Ichworth, afterwards Earl of Bristol.

To return to the Castle, the most remarkable historical event connected with it is the visit of King John, October 14, 1216. Hurrying from Lynn to the relief of Lincoln Castle, then besieged by the adherents of the Dauphin, his forces had been surprised by the tide as they crossed the sands of the estuary of the Wash, and he reached the Abbey of Swineshead on October 12, with the loss of his baggage-waggons and the royal treasure. Fever and dysentery seized the miserable man. His illness was aggravated by a gluttonous debauch, and he reached Sleaford Castle, the episcopal lord of which, Bishop Hugh of Wells, had joined the ranks of his enemies, borne in a litter, sick in body and still more sick at heart. The intelligence of the certain fall of Dover Castle, unless relieved, added to his misery. He was bled by a local leech, but his fever increased. But, ill as he was, he could not rest. The next day he started for another of the Bishop of Lincoln's castles, also built by Bishop Alexander, that of Newark-on-Trent. He rested awhile at the prison of Hough-on-the-Hill, passed through Brant Broughton, where one of his rare silver pennies, perhaps dropt on this journey, was picked up a short time since, and reached Newark, where he died on the night of October 18. Sleaford Castle was also the place of the death of Bishop Fleming, the first founder of Lincoln College, Oxford, the exhumed and burner of Wycliffe's bones in obedience to the decree of the Council of Constance, in whose case the attempt of Martin V., in 1423 to thrust a papal nominee on an unwilling Chapter by translating him from Lincoln to York was so signally defeated. Bishop William Alnwick, the spiritual counsellor of Henry VI., resided much here, and gratified his taste for building, of which the old palace at Lincoln exhibits remarkable proofs, by large additions to the Castle. Henry VIII. and his Queen Catherine Howard were twice here in 1541—August 8 and October 14—on their way to and from the North. As Longland, the then Bishop, was the King's confessor, and we know from Leland's account

that a few years later the Castle was still "very well maintained," the Royal party would probably be received within its walls as the Bishop's guests. Within a few years Somerset began the work of demolition, and the Castle soon became a stone quarry for the neighbourhood. In 1604 Robert Carr speaks of it as "the late fair Castle at Sleaford," and at the present day only an up-turned fragment of the north-western tower, with walls five feet thick, and the grassy mounds which mark while they conceal the foundations, remain to testify to its former grandeur.

The churches visited in the two days' excursions formed a series which few parts of England could rival, and certainly none surpass. South Lincolnshire is pre-eminently the district of fine bell-towers, and though the two queens, the spires of Louth and Grantham, fell outside the circle, it would be difficult anywhere to find a succession of more magnificent steeples. Their dignity, due chiefly to their admirable proportions and graceful details, is much enhanced by the quality of the fine-grained Ancaster stone of which they are built, which after more than five centuries shows hardly the slightest mark of decay. The soft grey tone it has acquired, warmed here and there with a blush of golden lichen, is charming in its contrast with the fresh green of the trees which usually fringe the churchyards. Eleven of the twenty-two churches visited have spires any one of which would be an object of admiration in a less favoured county. Of these, that of Sleaford is the earliest and least admirable. The tower is low, and the spire of the broach form is stunted. The whole steeple is of transitional date, passing into Early English, and is of much value from the rarity of these earlier spires. Ewerby, Aunsby (a good example of careful rebuilding, stone for stone), Walcot, and Anwick (a lovely little gem, with a horribly mutilated chancel), have excellent spires of the broach form, which to many eyes is less pleasing than the more usual arrangement where the spire rises within the parapets, as at Heckington, Asgarby, Quarrington, Silk Willoughby, Billingborough, and Hellingham. The variety of outline and proportion of these spires was very noticeable. In some cases, as at Asgarby and Heckington, the spire is not well set on the tower. It is too small in diameter, and gives the idea of part having slipped down into the tower like a candle into a socket too big for it. As a broach, Ewerby is unrivalled both in proportions and execution. But it is almost too severe. Some one has called it "the old maid among spires," tall and dignified, but prim and almost Quakerlike in its simplicity. At Silk Willoughby the spire is well set on; but the angle pinnacles, as in some other cases, are low and mean, and the flying buttresses, connecting them with the spires, which we could usually, except at South Hellingham, wish away, are so thin and fragile that they look almost like tapes tying the tower and spire together. At Asgarby and Walcot the dignity of the spire is lessened by lines of crockets running up its edges; and in other cases, notably at Anwick, it is overloaded by gabled towers, injuring the soaring conical outline. Of all the spires seen, we are disposed to give the palm to that of Hellingham. The proportion between spire and tower is admirably maintained. The pinnacles, square in plan and panelled, hit the happy mean between excessive tenuity and heaviness, and the flying buttresses are sufficiently pronounced without obtrusiveness. The crocketed edges are a slight blemish. The whole west end, with its sloping aisle roof, flamboyant windows, and richly-moulded west door—the only west door, with the exception of that of Sleaford, seen in the excursions—stately tower, and soaring spire, is one of rare excellence.

Great Hale was one of the towers of pre-Norman style, with perfectly plain, thick rubble walls, without buttresses or turret stair, the double belfry window having a mid-wall shaft. Unhappily four late pinnacles have been added. Howell has a very good example of a double bell-gable, a very unusual feature in Lincolnshire. Falkingham has a truly noble pinnacled western tower of Perpendicular date, of much better proportions than that of Newton, where the uppermost of the four stories is almost a superfluity. Horbling and Swaton are cruciform churches with central towers. That of Horbling, originally Norman, from faulty construction at the first, has been crushing the whole of the church for the last seven centuries, and more ominous cracks opening since the last restoration, show that, in architect's language, the building is still "alive," and we fear that the only remedy will be to take the whole tower down, and re-erect it on more sufficient foundations. The church, with its Norman chancel, a fragment of Norman intersecting arcade on the west front, and Norman work in the transept, is of so much interest, as showing the scale and character of a village church in the middle of the twelfth century, that any downfall which might at any time happen would be a grave architectural calamity. Heckington, though cruciform in plan, has no central lantern, and the transepts only range with the aisles. They thus lose their *raison d'être*, and both externally and internally have a feeble look, which is anything but pleasing, and is here increased by the nave wall being carried beyond them, with windows in two tiers, the aisles being omitted. Indeed, admirable as Heckington Church is as being, in Mr. Sharpe's words, "the most complete example of a parish church of the curvilinear period in the kingdom, designed and erected throughout in one style," and unrivalled as it is in the tracery of its windows, the elegance of its mouldings, and the richness of its sculptured decorations, as a whole, especially within, it is somewhat disappointing. Indeed the designers in the Decorated style are open to the charge of "turning all their best architecture out of doors," far more care having been bestowed on the exterior than on the interior of their buildings. Internally

these churches are usually plain; the arcades, though lofty, and well proportioned, are excessive both in height and width, and deficient in richness of moulding. The walls are plain and unadorned, and there is an absence—except in special features "*purpurei panni*," such as piscinas, sedilia, and Easter sepulchres—of carved or moulded work. The effect of the vast and nobly proportioned interior of Heckington is certainly bare and naked; nor is it improved by the walls having been subjected to the vile scarifying process which has laid bare all the articulations of the skeleton, and to make them more obvious, accentuated them with dark mortar. Indeed, so much in love has the restorer been with his evil work, that he has even carved dark lines across some larger stones, indicating a seam where none exists. In other respects this noble church has been fairly restored. The flat chancel roof awaits funds for elevation to its original pitch. The lovely tower is as little improved by the addition of a new clock-face of the brightest blue as the south aisle wall of Falkingham is by a projecting chimney, of the meanest brickwork, recently erected. We had hoped that at this period such deformities were impossible.

Most of the churches visited had been well and carefully restored and appropriately seated. Others—such as Silk Willoughby, Ewerby Hale, Billingborough, and Kirkby Laythorpe—have their interiors encumbered with vast square pews, lined with fusty green baize, and are deformed by rude barn-like roofs, contrasting painfully with their lovely arcades. At Billingborough the chief obstacle to the much-decried restoration is in the Office of Woods and Forests. The Crown is unhappily lay improprator; and when, a few years since, an appeal was sent from the parish for the substitution of a suitable roof for the uncouth timbers—really, we believe, brought from a neighbouring barn—which now encumber the Early English chancel, the reply was that the roof was watertight, and so fulfilled its purpose, and that any alteration was needless. The condition of Silk Willoughby Church is altogether unworthy of a building which Mr. Sharpe has pronounced to be "an admirable model of a small parish church." The church still boasts of the almost extinct three-decker, with a ludicrous little box for the parish clerk at the base, and the altar arrangements are of the meanest. The altar-stone, with its five crosses, lies in front of the south door, to be trampled on by all who enter. Dembleby and Burton Pedwardine are small new churches, well designed, especially the latter. The former retains a Norman chancel arch, and a holy water stoup of the same date now serves as a font. The latter, once a large cruciform church, only preserves a side chapel, with some interesting monuments and brasses. On the eastern wall is a blocked doorway, some feet from the ground, once approached by steps, with a platform outside, probably for the exhibition of relics. A lovely square piece of iron scroll-work of the thirteenth century may have formed the open front of a *chaise* containing a holy skull, or other wonder-working remains. The queerest church visited was that of Kyme. Though now a mere oblong room, with a flat ceiling, without chancel or tower, it is a fragment of a once noble cruciform priory church; and, in its gabled buttresses, flamboyant windows, and rich Transition south door, preserves remnants of its former magnificence. The church is vaulted up out of the south aisle and a narrow longitudinal slice of the nave of the original church. On the north wall a mutilated brass records the burial-place of the mother of Henry Fitzroy, Duke of Richmond, base-born son of Henry VIII. The fair frail one who bore this promising boy to her Royal lover was Elizabeth, daughter of Sir John Blount of Kinlet, in Shropshire, and wife of Gilbert Taylboys, lord of Kyme. Those who were present at the meeting of the Archaeological Institute at Ripon, in 1874, will not easily forget the touchingly plaintive dirge on the death of this hopeful prince, entitled "a lyttel ballett made of y^e young Dukes grace," discovered in the Chapter library, which was then performed by the Cathedral choir. The existence of such a dirge proves the affection felt by the nation for the poor lad and their grief at his premature death. He was born at Blackmore, in Essex, in 1519. In 1525, at the Court of Bridewell, he was created Earl of Nottingham and Duke of Richmond and Somerset. He was married to Mary, daughter of Thomas Howard, Duke of Norfolk, and died *sine prole* 1536. It is curious to think, if he had lived, how different the whole course of English history might have been. Henry's imperious will which illegitimized his daughters Mary and Elizabeth would hardly have scrupled to legitimize him, and the throne of England might have been his. Of the Kyme manor-house, a noble four-storied square tower remains, evidently built as a place of refuge in case of siege, of which and of the adjacent priory an excellent account was read by Mr. Charles Kirk on Thursday evening.

SIBERIA TO SWITZERLAND.

DURING the last week there has been a decided run on run-aways—a godsend to the unfortunate journalists, who are forced, contrary to their habits in June, to see all things in the Land Bill. Several artillerymen have run away from Plymouth Citadel, and a distinguished Russian irreconcilable has run from Irkutsk to Geneva. The last run, it is hardly necessary to say, was not accomplished in a day, or in a week; but its interest is more considerable than that of most slow races against time. The incident has naturally set most instructors of the public on rubbing up their memories of Trenck, Latude, Casanova, and the other

hence of remarkable escapes. It may be noted, by the way, for the instruction of the curious, that a large number of documents bearing on the Venetian imprisonment of the agreeable scoundrel mentioned last on our list have just been unearthed by a scholarly critic in the new French bibliographical publication *Le Livre*. So Jacques de Seingalt was not such a liar as he has sometimes been thought to be, a diminution in the list of his gentlemanlike or ungentlemanlike vices which still leaves him plenty to repent of. We owe, however, something of an apology to Mr. Mokrievitch for comparing him to the three persons just mentioned. He was not an incorrigible coxcomb like Trenck; nor a libeller, real or supposed, of ladies, like Latude; nor a corruptor of the pure and virgin morals of Arcadian Venice, like Casanova. He was a Russian Revolutionist, which is a profession "surprising by himself" a good many classes and varieties. At the time when Mr. Mokrievitch had to "come down" to the Russian police, the Nihilists had not taken to skirmishing with nitro-glycerine, at least not as a regular thing. Mr. Mokrievitch assisted at an irregular printing-press, such as erst our Bolingbroke loved to unearth and persecute. Even two hundred years ago, however, the English law had an irrational tenderness for the instructors of the public which made the game of Police v. Press not less exciting, but much less sanguinary. The complaints of the greatest English man of letters of that day show that the quarry had plenty of "law," in the favourable sense, given to them. "We take them, and they get out on bail; we take them again, and they get more bail," laments Swift in effect, if not in words (for we quote from memory). Mr. Mokrievitch played the same game for much higher stakes. The sanctity of the editorial chamber was invaded by the myrmidons of power, and some vigorous shooting took place. Luckily, Mr. Mokrievitch was not present at the moment; and so, while his collaborators were hanged, he was only sentenced to a fourteen years' "stretch" in Siberia. The narrative which the Geneva Correspondent of the *Daily News* gives of Mr. Mokrievitch's escape is in many ways curious. It reveals (not, indeed, for the first time) a remarkable laxity in the arrangements for the safeguarding of Siberian convicts. And yet it is said that Mr. Mokrievitch is the first State prisoner actually convicted and condemned who has now escaped from Siberia for a century. Perhaps the two statements are not so irreconcilable as they look. De Quincey, in that remarkable essay on the Cæsars which perhaps shows him at his very best, accounts for the general habit of suicide on the part of convicts or suspects under the Roman Empire by supposing a simple feeling of inability to escape from the very moderate exile to which they were condemned. The Empire was everywhere, and the facility of evasion from Tomi, or Pantelluria, or Gyarus, was compensated by the certainty that wherever the fugitive went the Empire would be also. The Czar of all the Russias is not quite so omnipotent as the original Cæsars. But he holds something like the half of two continents, and it is a very far cry from any central part of his dominions to the regions of neutrality and independence.

There are, however, compensating circumstances. An island is naturally a more difficult place to escape from than any part of the mainland, and various prisoners, from the Count of Monte Cristo to Marshal Bazaine (by the way, might not English writers think twice before throwing mud in obedience to the dictates of French political animosity?) have found their account in the presumed security. So, too, the apparent impossibility of a prisoner traversing the enormous length or breadth of European and Asiatic Russia seems to have imposed limits on the watchfulness of his appointed guardians. Fortunately, too, Russians are always venal and almost always good-natured. The corporal in charge may have that ill-regulated love of the stick which children and young Bachelors of Arts fresh from the University and appointed to schoolmasterships frequently display. But it is a case of "j'aime Bacchus, j'aime Manon," and it is even pleasanter to put money in one's purse than to put weals on the back of an accidental and not specially obnoxious fellow-creature. The benefit of these truths Mr. Mokrievitch quickly found. The conveniences of civilization in the shape of railways and steamers foiled himself and his companions somewhere east of Nijni Novgorod, and they did the rest of the distance "on foot and in chains." Fifteen miles per day, which seems to have been the usual stago, is not much on foot, but we own to a want of experience in the matter of chains. The resting-places were verminous and destitute of civilized arrangements, but it might be well to suspend inordinate compassion on this head. The "companionship with vermin," which a frequently-quoted libeller of the crusading age has assigned to the constituents of Mr. Gladstone and their compatriots generally, is now more characteristic of the ordinary habits of the Czar's subjects than of any other European people. Once in Siberia Mr. Mokrievitch began to enjoy the privileges and benefits of the situation. Some of those benefits and privileges Dostieffsky's famous book has made known, and they savour a little of Norfolk Island and Tasman's Peninsula. Others, however, are strictly moral. You (being a political prisoner) give an ordinary convict certain roubles, and he changes names and dresses with you. The advantages to him are, besides the roubles (of which he probably thinks most) a shortening of his sentences; to you the avoidance of extraordinary surveillance. Very soon afterwards Mr. Mokrievitch and two of his companions who had made the same exchange "sloped." One was caught; of the other the Siberian wolves are supposed to have taken cognizance.

It is thus obvious that escaping from Siberia is not a proceeding altogether without its dangers and difficulties. Mr. Mokrievitch, however, had greater skill, or greater luck, or both combined, which is most probable. Like an intelligent person, he made first for Irkutsk itself, knowing that the sweet security of towns is to no one more sweet and more secure than to the man who wishes to avoid observation. Then he bore away, for many a hundred miles, towards the Chinese frontier. There, on the face of it, would seem to have lain his best chance of escape. But possibly the frontier is strictly guarded, and travelling through Northern China is notoriously difficult, while the officials are inquisitive and quite capable of handing back a prisoner whom they had nothing to gain by keeping. So Mr. Mokrievitch imitated the tactics of the artful hare and doubled back towards Russia in Europe. Everybody seems to have befriended and protected him, and though he met with many "hardships" and "adventures" which, if he be an intelligent person, he will put in black and white, and sell to Bacon or to Bungay, his evasion appears on the whole to have been little more than a long and exciting walking tour, performed (for he can hardly have had much money) at very trifling expense.

Considerations already given show that it would be illegitimate to infer that Siberia is an altogether insecure place of detention. Mr. Mokrievitch appears to be one of the rare exceptions which really do prove a rule. Still there are features about his story (which seems to be quite modest and trustworthy) deserving the attention of the very unfortunate Sovereign who is, by his own will, immured at Gatchina or Peterhoff, and who is, let us trust, rather more carefully looked after than Mr. Mokrievitch. According to trustworthy accounts, the Russian prisons are simply crammed with prisoners, and the only possible gaol delivery is in the direction of Siberia. If it be true, as a Correspondent of the *Times* asserts, that a foreign sailor for a drunken "spree" in port, which in any other country would have earned him a trifling fine or a few days' imprisonment, has recently been packed off to Asiatic Russia, it is quite clear that a good deal will happen before long. Such things can only occur when the authorities have completely lost their heads. Siberia is supposed to be a safe pound, and all wandering cattle are driven into it without ceremony. But Mr. Mokrievitch has shown that its safety may be easily exaggerated. The country people, it is said, and the expression seems to apply equally to European and to Asiatic Russia, are noted for their kindness to fugitive convicts. That kindness is not likely to be diminished by the knowledge that an increasingly large proportion of those convicts have been sentenced only for trifling political offences or for other more trifling offences of the non-political kind. Sir Wilfrid Lawson and Mr. Dawson Burns may think the sailor rightly served; but persons not averse to vodka will scarcely agree with them. The more convicts there are in Siberia, moreover, the more easy will it be for them to escape. Meanwhile, Mr. Mokrievitch has, as we have suggested, the materials of a very promising Yellow-book, which, no doubt, any of the Geneva booksellers will be proud to bring out. It is unfortunate for him that the lively pen of M. Tissot has got the start of a month or two with a story of Siberian escape, in which there is an interesting young woman, and a penitent *gendarme*, and many fights with furious beasts, and other such like attractions, which may possibly be wanting to Mr. Mokrievitch's over-true tale. But, whereas the hero of M. Tissot's (and his collaborator M. Amérou's) tale only had to go to the Arctic Sea, where a convenient imitator of Professor Nordenskiöld picked him up and took him to regions of safety, Mr. Mokrievitch, as has been said, "did" Siberia thoroughly, and European Russia as well. In the latter country he of course had to get "false papers." Does anybody know the reason of the remarkable ease with which false papers are always to be procured? It has been suggested that this reason is to be found in the fact that, every set of papers being a source of revenue to somebody, the somebodies naturally consider your false man's money just as good as your true man's. What with false papers, friendly peasants, arrangements for exchanging identity, and so forth, it cannot be said that Siberia is altogether an unexceptionable receptacle for troublesome persons. On the other hand, Geneva appears to be rapidly becoming a kind of foreign St. Petersburg. For some reason, not wholly obvious, Russian exiles do not favour London nearly so much as most other outcasts. Germans, Frenchmen, "Polen aus der Polackei" flock to us when they are in trouble. But all good Nihilists, when they escape, go to Geneva or Zürich. The women have the opportunity to become Dr. Sophia and Dr. Vera; what the men have it is hard to say. Perhaps cigarettes are cheaper than with us; perhaps the youthful reformer of the universe likes to feel himself like Voltaire. But, however this may be, Geneva is evidently on the way to become the place where Siberians, with a self-given ticket-of-leave, do not report themselves to the police.

FRANCO-AMERICAN GRAPES.

THERE is hope for toppers yet, and it is a lady of high degree who bids them be of good cheer. At the present moment the minds of those who drink not merely for the day, but look forward to the morrow, are full of disquietude. The phylloxera is growing fonder and fonder of France and French vine-roots. Hard winters he seems to enjoy, and chemical applications, for the most part, he apparently likes. Every season there comes the same sad story of more vineyards destroyed, more land which formerly produced

grapes given up to corn and oats. It has been said with some appearance of truth that one reason for the indifference which the French have shown latterly to commerce with England is to be found in the fact that their supply of wine is scarcely sufficient for themselves, and that the diminution of export is not therefore viewed with any dread. Of late dark rumours have been afloat that more tricks than ever are played with claret, and that large quantities of coarse Spanish wine, after passing through Bordeaux, where there is as much baneful dexterity as there is at Chteau, come to England as the product of French vineyards. There has been lately, incredible as it may seem, an increased boldness in the utterances of Sir Wilfrid Lawson and his followers, which is probably due to a belief that nature is aiding them. Greatly, therefore, will those who have the interests of wine at heart be elated by the news that at last there seems to be a chance of the phylloxera being successfully combated. These glad tidings are brought to suffering humanity by the Duchesse de Fitz-James, who, in the current number of the *Revue des Deux Mondes*, tells how the detestable parasite may be resisted.

Apart from the interest of the subject, the article, which is called "La Vigne Américaine," is well worth reading, as the Duchesse is an excellent writer. She begins her dissertation with a description of the strange mixture of apathy and terror which the French vine-growers have shown in the presence of the calamity that has assailed them. It is generally thought in England that the highest possible science is applied to the cultivation of the grape in France; but this is not by any means the view of the Duchesse, who is herself the proprietor of large vineyards. At the time of the advent of the phylloxera, she says, "les traditions les plus étranges, les théories les plus fausses, n'empêchaient pas la vigne de produire à elle seule le quart du revenu total agricole de la France." If there was so much ignorance, it is not surprising that the cultivators should have shown no great skill or energy when the enemy invaded them; but it is singular that they should have exhibited such imbecility as the Duchesse describes. They have been, she says, for the most part, first of all confident that their vineyards would not be attacked, then inert and helpless when the rapid death of the plants showed that the enemy had come. In consequence, "les vignobles disparaissent sans autre acte défensif qu'un décret déclarant envahi un département de plus." The advance of the phylloxera has been looked upon as being like the advance of the sea, something that may not be stayed. This, according to Mme. de Fitz-James, is the mistake of cowardice and indolence. The success which has attended the effort of some energetic proprietors shows that there is a remedy not very difficult of application, and not so expensive as to make it useless for all but the most valuable vineyards. This remedy she describes fully and carefully, though, as we shall endeavour to show, her description is not free from ambiguity. Before examining it, however, it will be best to give, in the Duchesse's own words, a description of all the methods at present in use for combating the phylloxera, premising that the insect shows a distaste for certain American vines, which is not a little remarkable, seeing that he comes from America. The Duchesse says:—

Les moyens de défense connus aujourd'hui sont palliatifs ou définitifs, — palliatifs pour prolonger l'existence de ce qui végète encore, définitifs pour constituer des vignobles résistants aux atteintes du phylloxera. Le premier, le plus durable des palliatifs, c'est la submersion; le second, encore à l'état expérimental, est l'emploi des insecticides partout où le revenu de la vigne peut suffire à la surcroît de dépense. Les moyens définitifs sont : 1° la greffe, pour transformer des vignes françaises en vignes américaines résistantes; 2° la plantation de vignes françaises greffées sur racines américaines résistantes; 3° la plantation de vignes françaises dans le sable.

Of these methods, grafting is the only one which is likely to be of general use, though the others may advantageously be employed in some districts. Submersion destroys the parasite, and the vines remain alive until a fresh crop of phylloxera appears on the scene of action. For obvious reasons, however, submersion is practicable in but comparatively few cases, and even where it is practicable, there are peculiar difficulties in the cultivator's way. If the soil is light and permeable, the water rapidly invades the land of neighbouring proprietors, who naturally enough object. If, on the other hand, it is heavy, the water remains on it too long, and in consequence the vines suffer. Planting in sand is successful, as the phylloxera cannot live in it; but the sand must be perfectly pure, as, if there is any admixture of earth, the objectionable insect manages to keep alive. Most insecticides appear to be worthless, and the use of those which are efficacious is liable to the great objection of being too expensive for the cultivators who grow the grapes from which cheap wine is made. Although this method of preserving the vines is still, as Mme. de Fitz-James says, in the experimental stage, a fairly effective agent for destroying the obnoxious parasite has, it seems, been discovered. The discovery is due not to any of the great men of science who have investigated the subject, as they have one and all failed, but to a M. Fichet of Versailles, who furnished the Duchesse with an insecticide which was successfully tried in one of her vineyards. The expense of applying it was, however, great, and the Duchesse observes that, to keep down the phylloxera the insecticide must be applied three or four times a year, and that poor grapes require it oftener than rich ones. Clearly, therefore, it cannot be used for the former, and must considerably increase the expense of making high-class wines. Also, it remains to be seen whether some effect on the flavour of the grape is not produced by the chemical preparation which destroys the parasite.

We come then to grafting, which, according to the Duchesse, is thoroughly effective against the phylloxera, and is the one really efficacious remedy likely to be of general use. As has been said, the insect originally came from America, and, unlike that later importation, the Colorado beetle, achieved at once a marked success. There has been considerable controversy respecting its origin in France, and some unfortunate men who innocently enough planted American vines have been execrated as having caused the ruin of numbers of their fellow-countrymen. That they have been unjustly blamed seems clear; but, though the American origin of the phylloxera has been denied, it also seems clear that he was brought from that country, having possibly been bred there by the totalitarians who are so powerful in the United States. If, however, America has caused the ill, she has also provided the cure. Some American vines the phylloxera absolutely refuses to touch, preferring apparently death by hunger to living on them. Replanting the French vineyards with American vines would, therefore, get rid of the insect; but there are difficulties in the way of doing this, and unfortunately the phylloxera may be right in the views to which he adheres with uncompromising tenacity. The French vine may be, and probably is, superior to that of America, and the parasite which is so justly loathed may be showing that he, at all events, possesses unerring taste. In order, no doubt, to preserve the characteristics of the French grape, grafting has been tried, and, according to Mme. de Fitz-James, the experiment has been completely successful, so that there is every hope of the progress of the phylloxera being stopped if only cultivators will show some energy. As appears from the extract from her article, printed above, two kinds of grafting are practised. A French vine may be grafted on an American stock, or an American vine may be grafted on a French stock. At first sight it seems probable that, when the latter operation is practised, the phylloxera will continue to live on the roots which he has found so much to his taste; but the Duchesse avers that there is little danger of his being able to do this, and that he will most likely be starved, as he deserves to be. Speaking of this process, she says:—

Le seul inconvénient sérieux, c'est la présence de la vigne française et le danger que ses vieilles racines phylloxérées constituent pour la jeune vigne indienne. Mais les avantages sont si grands qu'ils contre-balaient cet inconvénient, déjà très atténué si le greffon est d'espèce très résistante. L'entretien dominera cette situation, à laquelle succomberait infailliblement le labrusca. La racine française nourrit le greffon avant de mourir, et cela assez longtemps pour qu'il s'affranchisse et se crée des racines résistantes.

It is to be observed that these words, positive and clear as they seem, are not altogether consistent with what the Duchesse says later on in her article. While discussing the other method of grafting—to wit, the attaching a French vine to an American root—she speaks of the apprehensions of those who have said that the roots would be affected by the graft so as to become vulnerable, and declares that these fears are unfounded. She bids the timid ask the first gardener they meet about the effect of grafting, and then goes on to say:—

La réponse n'est pas douteuse; le porte-greffe restera ce qu'il était, même nourri de la sève descendante d'une autre espèce que la sienne. L'as plus dans le règne végétal que dans le règne animal, la nourriture n'influe sur l'espèce; la viande d'un bœuf et celle d'un cheval, nourris de même, garderont chacune leurs caractères distinctifs, quoique l'abondance et la qualité de la nourriture influent sur l'abondance et la qualité de la viande.

We trust that the writer's view is correct, but this statement is not altogether consistent with that quoted above, and, moreover, it seems scarcely in harmony with what is said in another part of the article. From the passage referred to it might be thought that the Duchesse was in favour of the process of grafting American vines on French stocks, but it seems that it is the other process which she prefers. Her description of grafting begins as follows:—

Parlons de la greffe. Tout d'abord toutes les greffes possibles et impossibles! L'année dernière, M. Champin s'est joué au milieu d'elles-toutes pour agréablement avec l'esprit d'un Français; M^{me} Ponsot les a étudiées dans un traité bref, sobre, utile, s'attachant à la soudure parfaite d'un greffon français sur une racine américaine. Après avoir lu et relu son traité, après avoir vu ses plants greffés et bien soudés, j'aurais voulu écrire au-dessus de la porte des Annereaux, ce temple du succès mérité: "Chi va piano, va sano; chi va lontano."

Now, if she is right in her views about the effect of the root, it is clear that the grape produced by the process which Mme. Ponsot loves must be American, and not French, and surely the Duchesse cannot view this result with indifference. It is difficult to avoid the conclusion that the grape of the New World is inferior to that of the Old. Possibly, however, the Duchesse is somewhat over-positive about the effects of grafting, and it may be conjectured that both systems will result in a hybrid fruit, not equal perhaps to the true French grape, but decidedly superior to the American. As the phylloxera insists on having pure French roots, his perfectly correct taste will result in his extinction.

The slight inconsistencies which we have pointed out are such as might naturally be expected when a subject concerning which there has been much controversy is dealt with; and they detract but very little from the value of the Duchesse's excellent article, which will doubtless be as widely read in England as in France, since it contains cheering views for claret drinkers, who are now so many and so fervent. The writer is clearly well acquainted with the matter of which she treats, and there is every reason for thinking that she is right in her cheerful assertions. The orthodox will probably sigh over the possible deterioration of claret and

Burgundy, but most men will think this a small evil compared with total deprivation, and will rejoice in the knowledge that, if cultivators will be energetic, an abundant supply of sound wine from Franco-American grapes may be procured.

THE TRADE BETWEEN FRANCE AND ENGLAND.

THE opinion grows stronger day by day that the negotiations for the renewal of the Treaty of Commerce between this country and France will fail. The commercial community feels that, unless more liberal duties are agreed to, it would be better to have no treaty at all; and the division on Mr. Monk's motion shows that Parliament shares in the feeling. On the other hand, there is no appearance of yielding upon the side of France. Too little is known of the negotiations to speak with any confidence on the point; but, as far as one can judge from semi-official utterances in France, there is no inclination to yield much. Some, indeed, of the papers supposed to reflect the views of those who guide the policy of France complain of the action of the Chambers of Commerce in England as unreasonable, and as throwing difficulties in the way of a satisfactory conclusion of the treaty, and even go so far as to tell us that threats will not influence their Government. But, on the other hand, it is admitted by the French Free-traders that France has much more to lose than England in this matter. The exports of France consist very largely of articles of luxury, and would therefore suffer more from the imposition of duties. The perception of this fact may possibly influence French public men, and induce them to make concessions when they find that English opinion is resolute. We are not without hope, therefore, in spite of foolish action on the one side and foolish talk on the other, that a satisfactory treaty will be concluded, but we have at the same time to face the probability of the failure of the negotiations. It may be worth while, therefore, to inquire what is the magnitude and what is the nature of the trade carried on between this country and France.

If no commercial treaty were to be concluded, it is not to be supposed that the trade between England and France would be put an end to. There was a considerable trade between the two countries before 1860, and since then the wealth of both has enormously increased. Besides, it is to be borne in mind that the new General Tariff of France is much more liberal than the tariff in force when Mr. Cobden negotiated his treaty with the late Emperor. Before 1860 the duties in France were, in many cases, actually prohibitory, and in very many more were nearly so; but the new General Tariff, though considerably heavier than the duties arranged for in Mr. Cobden's treaty, is still very much more liberal than those which prevailed before 1860. It is certain, therefore, even if the new General Tariff should regulate the trade of this country with France, that the trade itself would continue to be considerable. Still, it is equally certain that the trade would suffer a check. Enhancement of duties means enhancement of prices, and the dearer an article becomes the less is its consumption. This is the case even where the article is one of the necessities of life; but it is more especially the case where, as in France, the articles are, to a large extent, luxuries, and where France has not a monopoly of them. We may assume, therefore, as a matter admitting of no doubt, that, were the General Tariff to come into force against us, the exports of France to England would fall off, and that in return our exports to France would also dwindle. If we found a smaller market for our goods in France we should be obliged to turn elsewhere for our own purchases. But, if this be so, it is certain that France would suffer much more seriously than we should. Speaking roughly, the trade of the United Kingdom with France last year amounted to 70 millions sterling, while the total trade of the United Kingdom with the whole world amounted to nearly 698 millions. The trade with France was, therefore, but very slightly more than one-tenth, or 10 per cent., of the total foreign trade of the United Kingdom. On the other hand, the trade of France with the United Kingdom for the ten years ending with 1879—we have not by us the returns for last year—amounted to 625½ millions of francs, while the total trade of France with all the world exceeded 2,850 millions. For the ten years, therefore, the trade of France with the United Kingdom averaged a little under one-fifth of her total foreign trade; in other words, the trade of France with the United Kingdom is about 20 per cent. of her total foreign trade. Consequently, if the trade between France and England were to be entirely extinguished, England would retain 90 per cent. of her existing trade, whereas France would retain but 80 per cent. of hers. France, therefore, would lose twice as much as England, and as the French trade is very much smaller than the English trade, the loss would be proportionately even greater than these figures imply. Of course, as we have already said, there is no fear of the total extinction of the trade between the two countries; but, whatever may be the amount of loss in case no treaty is concluded, it follows from what we have just been saying that the loss to France would be much heavier than the loss to England; and as the foreign trade of France is smaller than the foreign trade of England, the loss would be even proportionately greater still. From this point of view, then, it will be seen how foolish is the conduct of France in placing impediments in the way of a satisfactory treaty between the two

countries. Our readers do not need such statistics to be convinced that unshackled intercourse between all the countries of the world is desirable in itself; but still it may be worth while to show how foolish, even from their own point of view, is the conduct of the Protectionists in jeopardizing the trade which they profess themselves so desirous to encourage. Analysing in a little more detail the nature of the trade between the two countries, we find that the imports from France into England consist to the extent of about 40 per cent. of articles of food, about 41 per cent. of articles of clothing, and the remainder—between 18 and 19 per cent.—of miscellaneous articles. Of the articles of food sugar stands first in value, if we take a review of the last ten years; but if we confine ourselves to the last two years we find wine the most valuable. Amongst the articles of clothing silk stands for nearly half the total imports—last year, for instance, exceeding 10 millions sterling out of a total of articles of clothing of less than 21 millions sterling. The only other of any great magnitude is woollen manufactures, amounting to 4,630,000*l.* The miscellaneous articles are all small individually, and are very numerous. Of exports of British manufacture and produce to France woollen manufactures are the most valuable, amounting last year to 3,650,000*l.* Cotton manufactures stand next, representing 1,770,000*l.* Coals, &c., stand for 1,550,000*l.*, and metals for 1,380,000*l.* All the other items are small in amount. Exports of foreign and colonial produce bought in England by French manufacturers are considerable, wool, for instance, representing last year the very large sum of 6,950,000*l.*

As regards the effect of the treaty in stimulating the trade between the two countries it is very difficult to speak. The treaty undoubtedly did very considerably develop the trade; but so many other influences were at work that it is impossible to say how much was due to the lowering of duties, and how much to the other influences. For instance, the rapid increase in wealth in both countries naturally stimulated the trade between them. So, again, did the improvement of the means of locomotion. So did the extension of telegraphs, and so did the improvements in the organization of credit. Another circumstance, too, has to be taken into account—namely, that France is a country of transit. A considerable portion of the trade between this country and Switzerland, for instance, passes through France, and so does a portion of that between Spain and England, as also of that between Italy and England. It would require a very minute analysis of the French commercial statistics to determine how much of the trade which is set down to the credit of France really belongs to that country, and how much to her immediate neighbours. It is noteworthy, however, that of late years the French trade with this country appears to have fallen off. This is contrary to the general impression here in England, where it is supposed that France has benefited more largely by the Cobden treaty than England—that is to say, that her trade has expanded much more than ours under its stimulus. However that may be, it can clearly be shown that of late years the French trade with England has been falling off, or, at least, has not been increasing. For instance, the imports into France from the United Kingdom amounted to 26 millions sterling in 1876, and in 1879 were under 24 millions sterling. So, again, the exports from France to the United Kingdom, which in 1877 exceeded 42 millions sterling, in 1879 had fallen to 33 millions sterling. It is to be borne in mind, however, that a large part of this fall is nominal only. In the interval the prices of all commodities fell immensely, and naturally, therefore, the total values of the imports and exports must have fallen also. It is quite possible that the amount of the trade may have been diminished but very little, although this large reduction is shown in the value. Another point to be borne in mind is that the years from 1876 to 1879 inclusive were years of depression and discredit, more particularly here in England; that there were universal complaints of loss of trade; and it is only natural that the trade of France should have fallen off as well as that of all the rest of the world. Lastly, it is not to be forgotten that the past ten years have sorely tried France. War, insurrection, agitation, unsettled government, failure of crops, have all visited her in succession, and sometimes in combination. She has also had to bear an enormous increase of taxation. And, furthermore, she has had to face a very severe competition with some of her Continental neighbours. For example, while her sugar crop has twice within the past few years been a partial failure, the Austrian manufacturers have immensely improved their processes of sugar-making, and are gradually gaining a stronger hold of the English market. It would not be safe, therefore, to assume that there has been any real diminution in the trade between the two countries. But it seems, at the same time, clearly established that there has been no increase. One other point is to be borne in mind, that there has been an increase in the duties upon English goods imported into France of late years. The Cobden Treaty was the first of the commercial treaties concluded by France, and the treaty with Austria was one of the last. By the treaty with Austria the duties were reduced considerably below those of the Cobden Treaty, and England, in virtue of the most favoured nation clause, benefited by this reduction. But when the treaty with Austria came to an end the duties of the Cobden Treaty revived, and this doubtless had an effect in checking the growth of the trade between the two countries.

ARCHITECTURE IN 1881.

WITH the painful exception of the death of Mr. Burges, the year which has been completed by the recurrence of the Royal Academy Exhibition has been an uneventful one as far as architecture is in question. Goths, Classicists, and Queen Anne's men are still loading revolvers for their perennial triangular duel, and no definite success can be scored on any side. The Law Courts are growing apace, scaffold poles are modestly extending themselves upon the Embankment, while St. Paul's gives neither sight nor sound of those wonderful innovations which we were told—we forget how many years ago—were in certain and speedy prospect so soon as the malign personality of Mr. Burges should have been banned from the sacred precincts. So we have to go back to the annual task, so eminently calming to a restless mind, of noticing the contents of the architectural room of the Royal Academy. The first thing which strikes us there is that, of all the architectural members of the Academy, only Mr. Street and Mr. Waterhouse put in appearances. Mr. Pearson and Mr. Norman Shaw are absent, while the privilege of the posthumous year has not been taken advantage of by Mr. Burges's representatives. Mr. Street appears with several designs. The glimpse which he offers of the nave of Bristol Cathedral, seen crossways, is very picturesque (1109), but not more picturesque than the reality. The interior of his new church at Kingston, in Dorsetshire (1101), built for Lord Eldon, is well thought out, dignified in the mass, rich in material, and complete in appointments. The monument about to be erected in the south transept of York Minster to the late Dean Duncombe (1093) deserves great praise. It is clearly a composition carrying out in Middle Pointed the general idea of the famous canopied tomb in Early English of Archbishop Gray, which stands in the same transept; accordingly it bears a considerable, but we are sure quite unintentional, resemblance to the monument designed thirty years since with a similar motive, by R. C. Carpenter, for Marshal and Lady Beresford, which stands in the churchyard of Kildown, Kent. We fear that Mr. Street's English Church in the Via del Babuino, at Rome, will prove to have either borrowed too much or not enough from Southern in contrast to Northern Gothic. Mr. Waterhouse's Central Institution of the City and Guilds of London Institute for the Advancement of Technical Education, which is to rise in Exhibition Road, South Kensington (1884), is the visible embodiment of a great scheme which has mightily perplexed the benevolent souls of Philosophical Radicals who have long felt the assurance of the cock that the City and all its guilds are merely one huge residuum of jobbing and guzzling. As the scheme is big, so is also to be the building, which is to be planted on the west side of the Exhibition Road at right angles to the British Museum of Natural History, so as to mask what still survives of Lord Palmerston's favourite sheds. The material is red brick, and the style upon the whole that of Queen Anne, varied, however, by a strange proclivity in the window heads and elsewhere to assimilate forms resembling those of Mr. Waterhouse's Neo-Romanesque Museum adjoining. The architectural activity so rife at both Universities is hardly at all represented in this exhibition. We observe, however, the Master's Lodging, University College, Oxford, lately built by Messrs. Bodley and Garner (1078), and can speak well of it as a quiet and graceful composition in that phase of Jacobean which has not cast off Gothic feeling. This is a style very appropriate to Oxford from the associations both of history and of art which belong to it.

Mr. Penrose has turned awhile from his vigilant care of St. Paul's as it now is to give a perspective picture, seen from the east, of the old Cathedral as it looked in the days when its spire was still intact, and including Paul's Cross, the foundations of which have of late years been discovered and laid bare (1060). A glance at this drawing is sufficient to show how little ground Dean Milman had for his depreciatory estimate of this Cathedral in comparison with other mediæval minsters. Mr. Bayoks's special manner in church-building is one which borrows as much from Early French as from the First Pointed of England, and as may be inferred from his choice of style, massiveness has been wont to be a favourite characteristic of his treatment, and one which has generally served him well. But we think that he has for once overshot the mark with this specialty in his Lewisham Mission Church (1047). Height and colour are satisfactory features about Mr. Alfred A. Hudson's Church of St. Peter at Southsea (1055). But the perspective, which is all the architect offers, is too crowded to enable us to judge if the proportions of the building will be successful.

St. Mary Church, Hammersmith, by Mr. Arthur Baker (1130), is a large cruciform building, which has evidently been thought out with the intention of its posing as a minster. But an odd defect in the knowledge of the fitness of things displayed by its architect in some conspicuous features defeats his good intentions. The eastward portion of the eastern limb is just so much lower than the westward one as to destroy the dignity which a sufficient choir possesses, and yet just so little lower as not to mimic a lady chapel; while the central steeple is a reproduction on an exaggerated scale of an idea which has its appropriate home in the rustic churches of Surrey and Sussex. What Messrs. Dunn and Hanson call St. Cuthbert's Church at Ushaw College, near Durham (1105), is really a stately apsidal college chapel, arranged as college chapels should be—as being, in fact, choirs in contrast to the naves of parish churches—namely, with longitudinal stalls. We should think that the acknowledged failure of the

attempt at Kible College Chapel to seat such a chapel transversely would make a repetition of the experiment impossible. Lahore Cathedral, by Mr. J. O. Scott (1127, 1131), is a cruciform cathedral in Early Pointed, with apse and procession path, apparently exhibiting but little endeavour to accommodate the arrangements to climatic considerations. We cannot praise the composition of the western steeples, made up as they are of attenuated fleches springing from intersecting saddlebacks. Mr. Crossland's vast design (1138), in a showy variety of Late Italian, described as the entrance to the students' stairs from the east quadrangle of the Holloway College, Mount Lee, Egham, Surrey, *mole ruit aud.* The tavern built at the Royal Albert Dock by Messrs. George Vigers and J. R. Wagstaffe (1104) seems successfully to grapple with the picturesque resources of the domestic style of James I.'s and Charles I.'s days. But we do not think Mr. Vigers has been happily inspired in his National Hospital for the Deformed in Great Portland Street and Bolsover Street (1120). The system of composition belongs to that late period of the seventeenth century in which the narrowness of the window bays is made conspicuous by a crowded line of pronounced pilasters. This is a thing which should be observed only to be avoided by architects who claim for themselves to have all ages and all countries to choose from. Mr. West Neve offers some Offices at Cranbrook, in Kent (1045), carried out simply and unaffectedly, and therefore effectively, in that characteristic rural Kentish of the seventeenth century which has grown out of the use of tile facings to the walls. In his Hove House, Chiswick, "a painter's home" (1040), Mr. Maurice B. Adams has unfortunately had recourse to the features of a later period of the seventeenth century, so that a pleasing outline is allied to details which are not worthy of the general idea. Messrs. Carpenter's and Ingelow's St. Oswald's College, Ellesmere, now in the course of erection (1095), one of Canon Woodard's surprising creation of schools, is a grave and practical composition in Perpendicular.

THE OPERAS.

HERR ANTON RUBINSTEIN'S opera *Il Demonio* was produced on Tuesday last at Covent Garden for the first time in London, when the opera was conducted by its composer. Herr Rubinstein does not appear among us as a novice. His works have been performed, with more or less success, at a great many concerts; but it is only now, for the first time, that he appears as a dramatic composer. Everything that could tend to secure a success was at hand, and he, at least, cannot complain that his opera has not had a fair chance of attaining that success. In one particular alone he had cause of complaint—namely, with regard to the chorus. With splendid stage appointments, gorgeous dresses, the best of singers, and a most enthusiastic and appreciative audience, it was hardly possible for the most fastidious composer to be dissatisfied. Nor can we think that Herr Rubinstein can have been dissatisfied. How much, however, of the plaudits was due to his popularity as a pianoforte player or how much to the worth of his work is a nice question which we will not here endeavour to solve, and which may be left open to public opinion. The opera, we are told, has sustained great success in St. Petersburg, and it may do so in London. It must be conceded that Herr Rubinstein has laboured under the disadvantage of having one of the most colourless of libretti to work upon. M. Lermontoff may be a Russian representative of the "Welt-schmerz" school, as we are elsewhere told, but judging from his work in *Il Demonio* he must be but an indifferent one, for his conception of the character, if character it can be called, of the Demon is that of a shadowy Bertram and Manfred rolled into one, without the dramatic strength of either. He is a tame uninteresting demon, prone to do mischief if you please, but not doing it with any zeal. It is indeed very difficult to find out whether he is a good or a bad demon; and if it were not for the fact that an angel in the beginning of the opera demonstrates with him, and urges him to give up his evil ways, we should be rather inclined to take part with him, so uninteresting are all the surroundings.

After a short orchestral introduction, the curtain rises upon a scene among the clouds; while choruses of more or less uncertain intonation, supposed to be sung by evil spirits, the winds, waters, fountains, trees, flowers, rocks, and an occasional zephyr, occupy the time. During the choruses a rift in the clouds discloses various phantasmal forms, and a kind of Guy Fawkes meant for the Demon is swung across by two very large ropes. When this is ended, the clouds rise, and present a scene of much beauty. On the left is the castle of Gudal, and on the right a rock, on which stands the Demon, and at the back is the river Aragua. The Demon on his rock denounces things in general, when an Angel appears from another rock, and a debate ensues, in which the Demon appears to get the better of his antagonist. When these immortals have disappeared, the maidens appear, singing a joyous chorus; and, shortly after, Tamara, the daughter of Prince Gudal, and betrothed to Prince Sinodal, appears on a terrace. Why Herr Rubinstein should introduce his heroine so unnaturally it is impossible to say; but Tamara appears singing a long meaningless cadenza. A pretty chorus accompanies Tamara until the Demon appears upon his rock. Tamara alone sees him, and is terrified at his words and appearance. He at once falls in love with her, and asks her to

go with him and be mistress of the world. Tamara, though frightened, is evidently fascinated, as is evident from the way in which she repeats the words of the Demon after he has disappeared:—

Là del mio cor avrai l'imper,
Là regno avrai sul mondo inter.

The scene then changes to a rocky pass in the Caucasus, which has been chosen by Prince Sinodal, the betrothed of Tamara, as a resting-place for himself and his troops. After the Prince has delivered himself of a most intricate air in praise of Tamara, whom he has evidently not yet even seen, he retires to rest; and while all are sleeping the Demon appears and determines to rid himself of his rival. This is effected by a surprise by a troop of Tartars, who come on the stage and miraculously slay the sleeping men, for they none of them know the use of the sword. This feeble fight over, it is found that Prince Sinodal is wounded, and finally he dies, and the curtain falls.

The second act begins with a bridal festival, which would have been complete had the bridegroom only been present. A messenger arrives, and states that Prince Sinodal is coming, but that fatigue and night have overcome him. Tamara is not happy at the news, but nevertheless the festivities continue, and a ballet is performed. Suddenly the news arrives that Prince Sinodal is killed, when mirth gives place to consternation, and shortly after the body of the unfortunate Prince is brought in on a bier. Tamara overwhelmed with grief makes towards it, and throws herself upon it. Her father, Prince Gudal, attempts to soothe her, but with no avail. Suddenly the Demon appears on an eminence evidently arranged for him, and Tamara, who alone sees him, is awe-struck. After the body has been removed, Prince Gudal and the others leave her to compose herself, when the Demon again appears, and to her questions as to who he may be returns the most evasive answers. Prince Gudal and the others return to find Tamara almost driven mad, and with a strong desire to enter a cloister. This her father at first will not hear of, but at the urgent request of those around him, he at last reluctantly gives his consent. With the retirement of Tamara into a convent it would be thought that the act might well come to a close, but the librettist thinks otherwise; for while the Prince Gudal is mourning the double loss of daughter and son-in-law, his retainers rush in and demand revenge for Prince Sinodal's death, which gives an opportunity for Herr Rubinstein to introduce a chorus in which the words *guerra* and *vendetta* are drowned in a wild confusion of noise.

In her seclusion in the convent, in the third act, Tamara finds no rest on account of the relentless Demon, whose mean character somewhat discloses itself in this act. He shows himself to her in his true colours, and declares his love, promising all that the world possesses if she will accept him and free him from the fate that heaven has ordained shall be his. At the critical moment, when he is just about to embrace her, the Angel appears, and she, dying in his arms, is carried in the orthodox fashion up to heaven, whilst the Demon takes an opposite direction.

To this libretto Herr Rubinstein has chosen to compose the music. Of this on a first hearing we can but say that that which is not steeped in the profoundest dullness is disfigured by simple noise. His Asiatic allusions are pretty enough in his songs for the pianoforte, but dragged through the weary length of such an opera as *Il Demonio* they pall upon the listener. We are inclined to think that, had the libretto been worthy of the artist, we might have had better work from his pen; but, as it is, we cannot speak with praise of the opera. Indeed our general impression is one of ugliness and loudness unredeemed by dramatic feeling. The part of the Demon has no character, either dramatically or musically considered, and the interest of the piece is further marred by the death of the leading tenor in the first act, while some of the music which Herr Rubinstein has given to the various parts, especially Sinodal's song, "Oh potessi almen volar," is most exacting to a singer's powers.

Mme. Albani took the part of Tamara, and sang and acted as only a first-class artist can do. At the best there is but little for her to do, but that little she accomplished with all the art that she is now justly famous for; while Mme. Trebelli sustained the unthankful part of the Angel with skill remarkable even in her. Signor Marini, as Prince Sinodal, sang the part with credit; and Signor de Reszke's Prince Gudal was a distinct feature in the opera. Signori Silvestri and Manfredi were respectively the Servant and Messenger to Prince Sinodal. With M. Lassalle, who played the Demon, we sincerely sympathize; for the part is not an enviable one for any singer to undertake, and he is much to be praised for having made as important a figure as he did in it on Tuesday last.

It is a relief to turn from *Il Demonio* to Signor Boito's *Mefistofele*, with its really fine scoring and exquisite melodies. The work has the not too common merit of growing upon one by repeated hearings. Its performance at Her Majesty's Theatre on Thursday night was, as a whole, admirable. Signor Nanetti showed, it is true, an unhappy tendency to the tremolo in his first scene; but he shook this off as the opera went on, and sang and acted with all his old skill and fire. Signor Campanini, who was in exceptionally good voice, sang, especially in the last scene, with rare beauty and taste, and acted with considerable spirit. Mlle. de Belocca may be congratulated on her fulfilment of the difficult task of taking up a part associated with the name of Mme. Trebelli. We speak last of the performance of Mme. Nilsson, for which no praise can be too high. Never has Mme. Nilsson given with greater force and beauty her part in

the garden quartette, with the strange and touching suggestion of tragedy underlying the ringing notes of laughter, and never, indeed, have her acting and singing both in the First and Second Parts seemed nearer to perfection. The stage-management was on the whole capital, especially in the *Walpurgis Nacht*; but there was a dangerous likeness in the working of the flying mantle of the first scene to the notorious pantomime effect attempted in the first scene of *Faust o Margherita* at Covent Garden.

JUNE RACING.

THE Manchester Cup is becoming one of the most important handicaps of the year, and it is already the most valuable. Even when the gambling on the Derby was at its height there was considerable speculation on the Manchester Cup, and as soon as the great race of the year was over, the betting men gave their undivided attention to the important handicap of the Manchester meeting. Fernandez was the first favourite. Last autumn, as a three-year-old, with 8 st. 11 lb. on his back, he had only been beaten by half a length for the Cambridgeshire, which was won by a four-year-old to whom he was giving exactly a stone. Two lengths behind him was Cipolata, who had once beaten Robert the Devil. At Ascot, Fernandez had run Bend Or to a head at even weights, and although he ran badly in the Two Thousand, he had won the Craven Stakes in a canter. He was now to carry the heavy weight of 9 st.; but this, at weight for age, was considerably less than what Isomony had carried to victory in this very race last year. The second favourite was Peter, who was a year older than Fernandez, and yet had 1 lb. less to carry. Contrary to expectation, Fernandez was hopelessly beaten long before the end of the race, and as the horses came up to the stand, Peter was leading. Just at this point, however, Archer, who has so often upset hopes when they seemed certain to be realized, came rushing up on a twenty-five-to-one outsider. This was Captain Macchell's Valour, the winner of the first race at the late Epsom Meeting. Hitherto his career had not been by any means an unvarying success, but he had occasionally won races, and although he is six years old, his victory in the Manchester Cup with 8 st. 9 lbs. on his back was a highly creditable performance.

The Grand Prix de Paris was scarcely so interesting a race this year as usual. The French Derby had been won with great ease by Albion, and this horse was to run for the Grand Prix. Tristan also belonged to a Frenchman, but all his performances had hitherto been over English racecourses. He had shown some form as a two-year-old, but he had run wretchedly in both the Two Thousand and the Derby. Scobell had been an uncertain performer, both as a two-year-old and as a three-year-old; but he had run like a racehorse of high class on several occasions. His last race had been for the valuable Epsom Grand Prize, which he had won very cleverly under a heavy weight. But the best public form was that of Foxhall, a colt that had been bred in America. In the City and Suburban he had run second to Bend Or, many good horses being behind him at something like weight for age. Last year he had been beaten once, but he had won a couple of creditable races. The result of the Grand Prix was a tremendous race between Foxhall and Tristan, ridden respectively by Fordham and Archer. Foxhall won by a head. Albion was third, some four lengths behind the leading pair. The stake was more valuable than that of the Derby. Foxhall's victory was a great triumph for the Americans; if the same horse had won both the Derby and the Grand Prix, they would have had a great deal to boast of; how much more proud, therefore, ought they to be when the greatest English and the greatest French race have been won in the same year by different American horses belonging to different American owners.

Before proceeding to notice the racing at Ascot, we will observe that the sale of the Mardon Deer Park yearlings, which took place at Sandown Park on the 11th instant, was a great success. Twenty yearlings were sold at an average very little short of 300 guineas apiece. The highest price realized was 1,050 guineas; but no other single lot went for more than 500, and only eight out of the twenty fetched less than 200, so the prices were unusually even. Only two lots went under 100 guineas, and the lowest price taken was 65 guineas. This speaks far better for a stud than if a couple of yearlings had brought in 2,000 guineas each, while a large number had been 20 or 30 guinea weeds.

The racing on the Tuesday of the Ascot week was below the average. In general, the racing on the first day of the Ascot meeting is about the best of the season. But, although the sport of Tuesday week was not what it might have been, there was plenty of excitement. Weight-for-age races are supposed to be far less risky things to bet upon than handicaps. Indeed, there are Turf moralists who look upon gambling on handicaps as a sin, while they regard betting on weight-for-age races as one of the duties of man. Such people had a nice opportunity of putting their principles into practice in the race for the Gold Vase. Three horses were to start, Peter, Monarch, and Ambassador, and, on public form, the backers were perfectly justified in laying 3 to 1 on Peter. There seemed to be no doubt about Peter's powers to win, but, unfortunately for his backers, "he had other objects in view." He gal-

loped away beautifully until he reached the part of the course which was nearest to his stables, when he determined to go home and leave Monarch and Ambassadors to finish the race by themselves. He stopped short, and when urged on he kicked and bucked in a highly reprehensible manner. The most energetic of his backers, perceiving that their champion had failed them, hastened immediately to lay 6 and 7 to 4 on Monarch, in order to recoup themselves; but this was only throwing good money after bad, for Ambassadors, a four-year-old that had never won a race previously, came away and won in a canter by four lengths. So much for the certainties of weight-for-age races! It had been expected that the winners of the Two Thousand and the Derby, who had also been the first and second in each of those races, would have fought their battles again in the Prince of Wales's Stakes. Unfortunately Peregrine had a slight cough, and did not start, and the race was considered almost a foregone conclusion for Iroquois; but, although he won the race, he had to gallop as fast as his legs would carry him in order to pass the winning post in front of Geologist, to whom he was conceding the considerable weight of 9 lbs. The Ascot Stakes was an unsatisfactory affair, for as Retreat and Teviotdale were running in together, the former managed to bump heavily against the latter; so, although Retreat came in first, the race had to be awarded to Teviotdale, who had won it last year. There was a good race among some two-year-olds for the Biennial. Purple and Scarlet won by a head, then came Amali, and a head behind him were the Zee colt and Haverhill, who ran a dead heat for third place. All four were carrying the same weight. It may be remembered that in the Woodcote Stakes at Epsom Dunmore had beaten Purple and Scarlet by a neck only at even weights. These two races must be carefully borne in mind by students of two-year-old form, for whatever difference there may be between those five colts in the future, they were presumably within a very few pounds of each other at one time. Archer and Cannon rode a beautiful race, in a match, on two fillies by Wrenlock, the half-sisters running a dead heat.

After Peter's misbehaviour on the first day of the meeting there were great differences of opinion as to the desirability of backing him for the Royal Hunt Cup on the Wednesday. Nevertheless he became a strong favourite, and he was backed at starting at 100 to 30. He seemed to be in a bad humour again, for on the way down to the post he stopped so short that even the famous Archer suffered some "displacement" for a moment. The brute then set to work to get rid of his jockey. In this, however, he failed, and although Archer had a very unpleasant ride, he reached the starting-post on his horse's back. There again Peter gave some specimens of his vagaries. He bounced about like an india-rubber ball, and he excelled the mechanical horse in the variety of his movements. When the field of twenty horses at last got off, Peter started with the rest, but he had not proceeded far when he stopped short and kicked as viciously as a mule. All hopes of his winning now seemed to be at an end, for even a bad start is generally irremediable in the Hunt Cup, and now the body of the field had got a long way ahead. But Archer was resolute, and taking his wrong-minded charge by the head, he started in pursuit. Finding that his nose was turned towards his beloved corn bin, Peter now took it into his head to go home as fast as he could, and passing his opponents one after the other, he eventually gained the lead, and won the race by three-quarters of a length. Considering the heavy weight he was carrying (9 st. 3 lbs.) and the ground that he lost early in the race, this performance of Peter's ought ever to be memorable in the annals of Ascot. Well as Archer had ridden in the Hunt Cup, he showed his skill still further in the Biennial a little later in the afternoon. Limestone had beaten Scobell, and was apparently winning when Archer swooped down upon him with Voluptuary, and just won the race by a head. Sir Charles, who had been such a hero at Ascot a year ago, was fourth. Scobell had been the first favourite, with odds laid on him, and he ought to have run better. In the Epsom Grand Prize he had given Voluptuary 4 lbs., and beaten him easily, and now that they were running at even weights, Voluptuary galloped past him as if he were standing still. His excuses must be that he had only arrived from Paris the day before the race, and that he had got a cough. Many trainers were complaining at Ascot of the prevalence of coughing among their horses. Both in England and in France, horses of all kinds have been suffering lately from a bad type of influenza, which has proved fatal in many instances, and it is said to have been worse on the other side of the Channel than on this.

The Thursday was but a dull day's racing. It was a mere form for Robert the Devil to canter in five lengths in front of Petronel for the Gold Cup, and although Iroquois only beat Léon by half a length for the St. James's Palace Stakes, he could evidently have galloped right away from him if his jockey had wished it. Count Lagrange won the valuable Rous Memorial Stakes with Poulet, and Lord Rosebery won the New Stakes for two-year-olds, with his filly Kormess, who finished a couple of lengths in front of Kipgdom and four lengths in front of Shrewsbury, two colts which are considered far above the average. In the New Biennial Stakes there was a terrible upset of a strong favourite. The long odds of 7 to 2 were laid on Golden Eye, but she never looked formidable during the race, and finished third only to Skipetar. This sort of thing generally happens at least once or twice during every Ascot meeting.

It was a great pity that Bend Or was unable to run against Peter in the Hardwicke Stakes. Chippendale, Geologist, Preston-

pana, Poulet, Bonnie Doon, Cumberland, and Sportaman composed the field that opposed Peter, but they had no chance with him, and he came in eight lengths in advance of the nearest of the party. Altogether, Peter was quite the hero of the Ascot meeting, although he distinguished himself as much for wickedness as for speed. The Alexandra Plate was a mere exercise canter for Robert the Devil, and he came in as he liked, Exeter and Reveller following at a very respectful distance. Backers are likely to remember the Queen's Stand Plate. They laid 5 to 2 on Charibert, who was ridden by Archer. The great jockey made one of the rushes for which he is so justly famous, but even Archer is mortal, and for once, instead of winning by a head, he lost by a head, to the intense chagrin of the plungers; but in the next race, which was the last of the meeting, he showed that he had not lost his cunning, for he brought Lord Bradford's Sword Dance up in the last few strides, and won by a head in his most brilliant style. After Ascot races there is generally some discussion on the question whether the meeting has been most favourable to backers of horses or to fielders. During the late meeting, a backer who put the same sum on the first favourite for every race would have won rather more than two and a half times that amount in the course of the week.

The yearlings of the Cobham Stud were sold on the Saturday after Ascot, when good prices were realized, twenty-one yearlings averaging nearly 300 guineas each. Twenty-six other yearlings were sold (or bought in) in the course of the same afternoon, and these averaged over 200 apiece. The yearling sales, thus far, have been more successful this year than for some time past.

REVIEWS.

WHEELER'S HISTORY OF INDIA.—VOL. IV., PART II.*

IN this half volume Mr. Talboys Wheeler completes his history of the Moghul Empire. It is chiefly occupied with the reign of the Emperor Aurangzeb; and Mr. Wheeler gives the briefest of brief notices of that monarch's successors, but these notices may be said to be valueless. In our review of the first part of this volume, on April 22, 1876, we expressed an opinion unfavourable to that portion of Mr. Wheeler's history, and on reading this part we see little reason to give another opinion of the continuation. This part is a valuable contribution to history, but is too one-sided and incomplete to rank as a history. In the former part of this volume Mr. Wheeler showed his contempt for the native Mahomedan historians; and it is but too clear that he knows little about them or the language in which they wrote. He seldom fails to seize an opportunity of disparaging them; and, although his animadversions are sometimes reasonable, they as often show an incorrect and prejudiced apprehension. For many centuries we are entirely indebted for our knowledge of Indian history to the native authors who wrote in Persian, and their works deserve a most careful and candid sifting. No one can claim for them strict impartiality, full details of events, or accurate statements of dates and concurrent circumstances. But it is the business of the true historian to carefully compare and examine their statements, and to arrive, if possible, at some definite and plausible result. Mr. Wheeler's method is short and simple. He applies to them in particular what Sir R. Walpole said of history in general, and dismisses them with contempt and undisguised dislike. This volume, so far as it relates to Mahomedan history, is derived almost exclusively from European travellers in India. In collecting the evidence of these writers Mr. Wheeler has rendered an inestimable service. One of them, the Venetian physician Manouchi, resided in India forty-eight years; and his elaborate work, founded on personal observation and from diligent examination of the Persian chronicles and registers preserved at Delhi, is a most valuable contribution to the histories of the reigns of Shāh Jahān and Aurangzeb. His memoirs were written in Portuguese—why it does not appear, but perhaps when he was residing at Goa—and were adorned with portraits of the Emperors and many of the great men of the time. A French history of the Moghuls was published at the Hague in 1708 by the Jesuit father Catrou, which was based on the memoirs of Manouchi, and an English translation of Catrou's work appeared in London in 1826. Notwithstanding this, the work has remained unnoticed until it was unearthed, as Mr. Wheeler states, for his use by his publishers, Messrs Trübner. Manouchi's original work appears to be lost, or buried in oblivion upon some obscure book-shelves, but Mr. Wheeler has made full and good use of Catrou's version. The published English translation of it seems to be entirely lost, but a full publication of the whole work, in whatever form it may be accessible, is much to be desired.

The Emperor Aurangzeb with whom Mr. Wheeler deals in this volume, is a congenial subject for his mode of treatment. He can find little to say that is favourable of the best of the Musulman monarchs, and here he has one for whom little that is good can in honesty be said:—

By craft, hypocrisy, and bloodshed he had gained the empire of Hin-

* *The History of India from the Earliest Ages.* By J. Talboys Wheeler. Vol. IV. Part II. Moghul Empire, Aurangzeb. London: Trübner & Co.

dustan. His three brothers had perished in the fratricidal war. His eldest son had suffered death as a punishment for rebellion. His father Sháh Jahán was still alive, imprisoned in the fortress at Agra. The vision of Sháh Jahán was a constant terror to Aurangzeb; it poisoned his pleasures and paralysed his ambition.

This is a somewhat weak and incomplete way of representing the facts. One brother perished, or rather disappeared, in a rebellious campaign, but he was often asserted to be alive. The eldest brother died by an iniquitous public execution, and the third succumbed to slow poison in a government fortress. The father died in confinement a few years after Aurangzeb's accession. "How he perished is one of the many mysteries of the Moghul régime," says Mr. Wheeler, but he inclines to the general belief that the old monarch was poisoned. As to the punishment by death of the eldest son we shall have something to say hereafter. Mr. Wheeler has a just and hearty detestation of Aurangzeb's hypocrisy. Some writers have been blinded by the glamour of his religious professions, and have attributed to him a true feeling of religion and a hearty repentance of his crimes. But when the crafty monarch made a display of his penitence he was only one of the miserable sinners of the world, and had no word to say about his own especial crimes. His religious persecutions were in strict accord with his own gloomy and remorseless fanaticism; but, like all his public actions, they were greatly influenced by political considerations. He was a man of unbounded vanity and self-conceit. He condemned the system under which he had been brought up and educated, and had little regard and no affection for those around him, excepting so far as they were subservient to his political schemes. To secure a more perfect submission to the laws of his religion and to cement a more united body of Mahomedans he abolished the use of wine, and allowed the use of it only to Europeans, who were restricted to the use of it in their own houses. All Mahomedans who drank it were subject to the amputation of a hand or a foot, and the sellers of it to imprisonment or the bastinado. But it was all in vain; no edict could suppress intoxication, and the use of wine was universal. Aurangzeb remarked that there were only two men in the Empire who abstained from the use of wine, the chief Kázi and himself. Even there he was deceived. Every morning the Court physician carried a flagon of wine to the chief Kázi, and the pair emptied it together. Other great officials continued to indulge secretly in the same vice; and the bulk of the people, who were unable to obtain the strong drinks they so dearly loved, took to intoxicating preparations of a more dangerous character. One of his whimsical edicts was a prohibition of long mustachios, which he pretended were an obstacle to the distinct pronunciation of the word Allah. Mr. Wheeler sees in this an affront to the Shiáhs. However it may be, men were appointed who ran about with scissors to clip the mustachios of the passers-by to the proper shape. He had a hatred of music, and abolished singing and dancing. The public trade of the dancing-girls, the courtesans of India, was gone; and he ordered them all to be married—a somewhat strange punishment for such people—or to go into banishment. As might be expected, the trade which was formerly public became still more rife in privacy and concealment.

Notwithstanding all his defects Aurangzeb was a man of vast energy and determination. His iron hand alone could have kept the discordant elements of the Empire under control, and have struggled with success against the wars, internal and external, which continually assailed it. He lived to an old age, and he had the bitterness of seeing his sons, who were of ripe years and anxious for power, rebelling when they found an opportunity; each striving to secure his own succession, and paying little regard to the commands and feelings of their father. For all his personal faults, his hypocrisy, bigotry, and ruthlessness, he is still looked upon with admiration by modern Mahomedans in India as the greatest of their monarchs, or, at least, as second to none. His reimposition of the *jizya*, or poll-tax on infidels, and his consistent persecution of them, were more agreeable to the professors of an intolerant creed than the tolerance and genial spirit of Akbar. His wars with the Rájputs, over whom he claimed sovereignty, were not always successful, and cost him much anxiety and much blood and treasure. The great scene of his warfare was the Dekhan, where he subdued, as much by craft as by power, the Mahomedan kingdoms of Bijapur and Golkonda, and where also he had a life-long struggle with the "mountain rat," the Mahratta Sivaji and his successors. Mr. Wheeler, as he was bound, tells the story of Sivaji's murder of the Bijapur general, Afzal Khan, whom he had invited to a parley. Sivaji wore concealed in his hand a small weapon called *wag-nakh*, or tiger's claws. With these he unsuspectingly clutched the unfortunate general in the abdomen, and then despatched him with his dagger. There can be no doubt as to the nature of the weapon, for Grant Duff in his history has published a sketch of one; yet Mr. Wheeler, writing from imagination and not from authority, says, "He then drove the tiger's claws to the Musulman general's heart," a feat difficult of accomplishment and inconceivable to any one less confident in his own supposed knowledge than Mr. Wheeler. The arduous struggle in the south would have worn out a man of less vigorous determination and unshaken resolution than Aurangzeb, but he succumbed at last, and died in the eighty-ninth year of his age and the fiftieth year of his reign. The Moghul Empire is frequently represented as having attained the zenith of its glory in his reign, and no doubt it extended over a larger expanse than it had ever before reached. But the orb of empire was cracking and crumbling in his grasp, and when death relaxed

that tenacious and determined hold, the whole fell to pieces, and the country became the prey of fratricidal and internecine wars. The two elder brothers hastened from opposite extremes of the Empire, and settled their pretensions in a great battle near the Chambal, in which the second brother fell. Another, the fifth son, a rash and unmanageable soldier, who spurned all the kind and liberal terms of his eldest brother, met a soldier's death. The third son, Akbar, had rebelled against his father, but the fickleness of his Rájput allies lost him a battle, and he fled to the Mahrattas, by whom he was courteously received; but he was disgusted with their idolatry and coarse mode of life, and went to Persia, where also he was well received, and died some years afterwards in Garmair. Aurangzeb opened negotiations to get him back, but failed. There is doubt about the eldest son, Mahomed Sultan, who died when very young, and never makes any prominent appearance. He would seem to have died a natural death, but Mr. Wheeler unhesitatingly says he was poisoned. We should like to know his authority. Perhaps he has found it in one of the European travellers, or perhaps he has evolved it, as the phrase runs, from the depths of his inner consciousness.

Mr. Wheeler's summary of the contents of the writings of the European travellers is most interesting and valuable. These travellers vary in their acuteness and breadth of observation, but they all add something that throws a fresh light upon the state of affairs in different parts of India. Bernier and Della Valle are especially valuable, and the former has always found readers, from the liveliness of his style and his interesting details of the doings of the Imperial Court, where he was physician. A publication of a series of these travellers would probably be profitable; it would certainly render service, and give pleasure to the student of history. Catrou's version of Manouchi is especially desirable.

Mr. Wheeler has his prejudices and hobbies, to which he holds with desperate tenacity. In his plan of the Mahomedan history of India he divides it into four parts, the third of which, beginning with Aurangzeb, he named the "Sunni Revival," and under it he classed all the remaining monarchs of India. He here confesses that Bahádur Sháh, the successor of Aurangzeb, had the Shiáh form of the creed read in the great mosque, but that he was obliged to retract the innovation by the violent opposition of the religious world. Mr. Wheeler also returns to his hypothesis that the Aryans and the Moghuls are of the same stock. This brought down upon him some ridicule in this and some other periodicals. He here brings forward a number of circumstances in support of his theory, which are yet weaker than what he had formerly advanced. One alleged proof is remarkably inconsequential, even among the other trivial and worthless statements:—

The Moghuls are the so-called Children of the Sun, and to this day they carry a peacock on their standard. A peacock of gold and jewels blazed over the throne of the Moghul Emperor Sháh Jahán, and a peacock is still the standard of the Moghul Kings of Burma.

Now Sháh Jahán was not a Moghul, but a Turk, as Mr. Wheeler has himself taught in the body of his book; but, even if he had been a Moghul, this could have no bearing on the statement that the Aryan Hindus are of Moghul origin. Mr. Wheeler, as we have seen in previous notices, is very weak in his spelling and the use of accents, and his deficiencies would have received no notice here but for a note at the beginning of the work, which seems to be intended as a veil for this weakness:—"Throughout the following pages the names of 'Aurangzeb' has been altered to 'Aurangzeb,' and that of 'Rajpoot' to 'Rajput,' to suit modern orthography." Modern orthography has nothing to do with it. The words have always been spelt in the same way in their original languages. Aurangzeb is the most scientific form of rendering, which has always been more or less used; and Rajput, not Rajpút, has been the correct form for countless generations.

ENGLISH GARDENS.*

A PLEASANT and unpretending little volume by Mrs. J. Francis Foster, sets up "a plea for English gardens of the future, with practical hints for planting them," and the plea is, in fact, a plea for the revival of the past. In all projects or attempts for such revivals there is something fascinating and attractive; but the measure of resulting success is apt to prove very meagre and disappointing. The shadow will not go back on the sun-dial of life. We may build our houses externally in the style of any country, century, or dynasty we please; but we have not the slightest intention of making their internal arrangements, or our own manner of living within their walls, correspond with the period. The English garden, and its uses, are essentially associated with English domestic life; and it is only possible to reproduce a fourteenth or sixteenth century garden in the way in which the costumes of the time may be reproduced; the result being a sort of floral fancy-ball, as pretty, perhaps, but as unreal, as such an entertainment must be. Indeed, Mrs. Foster's little book *On the Art of Gardening* seems to be based on this very principle; for it is itself a kind of manual of costumes, drawn up for the use of the privileged and comparatively small class who possess, in time, abundance of leisure; in space, abundance of pleasure ground; and in establishment, abundance of available labour. It is addressed, in fact, to the very people who,

* *On the Art of Gardening: a Plea for English Gardens of the Future, with Practical Hints for Planting them.* By Mrs. J. Francis Foster. London: W. Satchell & Co. 1881.

when they are so inclined, entertain their guests at a costume ball. Not the less is it a pleasant kind of reading to the less favoured multitude which stands by on the pavement, and looks on.

There are two acknowledged grievances in the experience of every one who possesses a garden, of which it may be said that the greater contains the less, so that the two resolve themselves into one, the total inability of the owner of the garden to have his own way in its arrangement. The minor trouble which is involved in this general misfortune is that all personal associations and preferences, and all traditions of past gardens, are sacrificed and scattered to the winds in obedience to the laws of some fashion always as ephemeral, and often as hideous, as those which are imposed on the form of woman and the eyes of man by the tyranny of dress-makers. It is a pleasing thought, however delusive, that by restoring the garden of the past we can set ourselves free from the fetters of this bondage. The first step, or almost the first, which the reformer of the garden would find himself taking is an evidence of the altered system under which he is living. After reading the ample "Directions for planting a Chaucerian" or "an Elizabethan Border," he would make out a list of the seeds and plants required, and address it to the great nurseryman who presides over his district, and whose catalogues reach him regularly once a quarter.

In the beauty and sweetness of flowers there has always been a refreshment and delight for human life. Women have prized and cherished them, and men have valued them for women's sake, if not for their own. Admitting this to the fullest extent, and premising it in anticipation of its being alleged against us, we think that it must be taken for granted that the relation of the garden to English domestic life in former days was in the main utilitarian. Mrs. Foster quotes from Sir William Temple's Essay on Gardening a sentence which is directly in point:—"Four or five to seven or eight acres is as much as any gentleman need design, and will furnish as much of all that is expected from it as any nobleman will have occasion to use in his family." For the more immediate purposes of the household the garden would supply fruit, vegetables when they came into general use, and still earlier, herbs used for the "seasoning" which is said to have been the original form of vegetables as served with meat. But, besides these, the supplementary uses of the garden were many, in connexion with the simpler, more self-contained, and more home-keeping life of country houses in the past. All the old botanical works, and books as recent as the beautiful series of Sowerby's *English Botany*, published at the close of the last and beginning of the present century, are full of the medicinal and other uses of the commoner of our wild plants; and for these uses both native and foreign flowers were cultivated in gardens. Old ladies, till very recently, all unknowing of the existence and virtues of arnica, would barbarously strip the splendid white lily of its flowers in order to preserve the petals in brandy for exigencies commonly met by a brown paper vehicle or a raw beef-steak, and which, as we learn from a delightful passage quoted by Mrs. Foster from one of the old herbalists, have supplied the cause for retaining in our gardens the struggling weed known as "Solomon's Seal." An experiment which we once tried, but never repeated, and which we cannot recommend any one else to attempt, proved fatal to the hypothesis that it might be a substitute for asparagus, which it slightly resembles in its early shoots; and Sowerby has omitted to notice how "its bruised roots will take away blacke or blew spots gotten by fols, or women's wilfulness in stumbling upon their hasty husbands' fists."

The ladies of a country house in old times were more of house-keepers, as well as more of homekeepers, than they can be now. Their cosmetics, or "washes," as well as their scents, were to a large extent home made; and for these, as well as for the "cordials" prepared in still-rooms, the garden was made to supply the materials. They had their sweetmeats and "conservees" as well, provided from the same source; and of the herbs which they used for the production of these luxuries it may be hoped that the horrible vegetable called Angelica, a sort of gigantic parsley with hollow stems, is not a fair specimen. The uses of the garden in all these particulars have entirely passed away, although the old herb-doctoring still lingers in country districts, where traditional salves for burns, said to be more efficacious than anything to be had at the druggist's, are still compounded by old women from receipts orally received and handed down. The merely ornamental flowers in a garden were probably but an adjunct to their more useful fellows; and the name of the "border" in which they grew seems to indicate this supplementary position. The roses combined use and beauty in one; and the fading flowers were not consigned to the wheelbarrow and the rubbish-heap as they are now. Here and there a lead-lined urn or vase may still be found which retains, or seems to retain, the fragrance of their departed petals.

But the garden was the resource of leisure, as well as the repository for housewifely simples and luxuries. It was a place of meditation and conference for the master of the house and his friends, and not less the scene of graceful labours and gentle interests for the mistress and her daughters, in days when leisure was less hurrying than it is in our generation, and when as yet "garden-parties" were not. The personal care and tending of individual plants and flowers and trees was not unknown; and it is perhaps in this personal association with special growths that the difference between the garden of the more recent past and that of the present chiefly consists. Any one who, like Gilbert White of Selborne, should enter in his diary, or communicate in

society, or write to his acquaintances, the dates at which the apricot on his south wall flowered, or the golden-crested wren began to sit, would, unless he were known as an observer collecting his facts for purely scientific purposes, be set down as a recluse or a prig. He may certainly discuss the relative character of the peach and the almond-blossom, yet not in association with their comparative beauty as spring-flowering trees, but strictly as bearing on the question of development from the ideal or original berry, in the one case of a tough skin, and in the other of a fortified kernel.

The garden of an earlier age, with its uses and its interests, has become extinct more completely than its companion, the fishpond. The latter may, and even must, survive in the shape of ornamental water, or, if it seem fit to do so to talk about things on a more magnificent scale, as "the lake." It is required for skating-parties; it is convenient for the indulgence of a taste in fancy waterfowl; and it may be useful in a dry summer. But, as a fishpond, it is seldom wanted; and the fishpond, in the old monastic gardens at least, was a very important domestic institution. In much later times, and until the railway could be depended upon for the daily needs of the table, it proved a convenient and habitual resource, and the humble sport of bottom-fishing in it was far removed from its present level of contempt. It is now partly obsolete; and as the water has faded, so fades the land of the pleasure-ground. A modern garden-party neither knows nor cares anything whatever about the garden. Its day is over, and if the old rose-border interferes with free passage for the "gallery" of the tennis-ground, the rose-border must go. The garden was for the few; the garden-party is of the many. The garden was an adjunct of the house for the owner's friends; the house is an adjunct of the garden, or rather of the lawn, for the hostess's acquaintances. And, accordingly, the arbour or summer-house of the past, with its little rough table in the middle, comfortable for two and pleasantly crushed with half-a-dozen, has given place to a wilderness of chairs and rugs, with their familiar accompaniment of a stampede in a thunderstorm. Not that it is absolutely prohibited to take any interest in flowers, or to ask the hostess for permission to inspect her roses; but that the subject must be approached without the slightest breath of enthusiasm, and that appreciative criticism of the "collection" must not be spoiled by any folly of sentiment or poetry. The one unpardonable offence is to mistake the "Duchess of Connaught" for the "Duke of Edinburgh," or a "Pactole" for a "Céline Forestier."

It is impossible that the garden of a home-living society should retain its traditional hold on a society which scarcely ever looks upon it. Mrs. Foster's question admits of a ready answer:—"Why should we, who might have flowers from Epiphanytide till Christmas comes again, prefer to have them only for two or three months of the year?" In the first place, "we" do not "prefer" anything of the kind. "We" give our orders to the nurserymen and the florists, and we expect them to keep us properly supplied with window-gardens and table decorations, to say nothing of bouquets and buttonholes. And if we did take care that there should be no "brown, bare earth in flowerless borders" at our places down in the country "from Epiphanytide" (this year, at any rate) till the close of the season, *cui bono*? Who would see them, except the gardeners and the housemaids? In the social customs of the day, most likely, lies the real origin and the *raison d'être* of the "bedding out" system, which Mrs. Foster, with the true gardening instinct, detests, and would fain exterminate.

But there is an economical side whence some reasonable defence may be offered for that kitchen-dresser style of horticulture, in which the flower-beds on the lawn and elsewhere are regarded as so many plates and dishes to be filled with various kinds of food at stated times and washed and put aside in the intervals. The permanent flower-border requires a great deal of continuous labour to keep up in anything like presentable show, and in the heavier soils is almost impossible to be kept free from weeds. It cannot easily be dug over, and, except on a very small scale, it cannot be properly treated with manure. For gardens where the supply of labour is not abundant, and especially for those in towns, where dependance must be placed on the nursery-gardener to attend to each in its turn, the existing system probably provides the greatest amount of neatness and beauty at the least expenditure in time and cost. A Chaucerian or Elizabethan garden was in all likelihood a very untidy and weed-grown spectacle.

Mrs. Foster's pretty vision of the lawn planted with apple and cherry-trees, and the pink or white petals falling upon the children as they play, is, we fear, hardly reducible to the prose of practical life. Many years ago there was seen in the Academy a charming picture of a young lady in a thin dress lying at her graceful length amidst tufts of primroses, and bluebells, and "wind-flowers," and fresh grasses, and all sorts of glories of the spring beside a stream. There may perhaps have been a departing youth in an ill temper and the middle distance; for this memory does not serve; but the motto was concerning the "little rift within the lute which by and by will make the music mute"—a result manifestly not at all improbable as far as the "music" of the lady's voice was concerned. The painter, we trust, is by this time an R.A., and above any such materialist criticism; but Mrs. Foster's apples and cherries will be much better gathered in the future where they are at present, in the kitchen-garden and the orchard. The "peach-tree" and the "golden-drop plum," and the "purple perdrigon," which she would have us, on æsthetic grounds, "train upon the house-walls according to aspect," are, we think, open to several sound objections, among which we will

only mention window-thieves and earwigs; and we are generally disposed to prefer the formula with which a long-departed matron, a gardener after Mrs. Foster's heart, used to dismiss her summer tribe of grandchildren from the old-fashioned early dinner-table:—"My dessert is in the garden, my dears."

MRS. GEOFFREY.*

THIS story might be very fairly described as twaddle interspersed with quotations, or as quotations interspersed with twaddle. Whenever the author writes in her own person, the reader is irritated almost beyond measure by the feeblest nonsense. Whenever she quotes he is scarcely less irritated by the ridiculous display of her reading. He passes therefore through the book in a constant state of annoyance, and though he may for a brief time be amused by the author's silliness, nevertheless long before he reaches its last chapter he sinks into a state of hopeless misery. We have read far worse books than *Mrs. Geoffrey*, but for downright silliness—pretentious silliness too—it carries off the palm. Just as dealers in strawberries often fill the inside of the basket with worthless cabbage-leaves, and make a brave show of the fruit outside, so the author of *Mrs. Geoffrey* tries to hide the poverty of her thoughts by a display of quotations gathered from many an author. In such a case as hers we can see how much mischief is done by the *Manuals of Literature* with which our book-stalls are flooded. By half an hour's study or so the most ignorant person can learn how to speak with an air of assurance of some great writer whose name even hitherto had been unknown to him. Any one who is gifted with a fairly good memory and a large measure of effrontery could, we venture to assert, with a fortnight's reading pass muster as a prodigy of learning in any ordinary company. All the greatest authors have been reduced to *Manuals*, and in the forms of *Manuals* they are within the digestion of even the feeblest. Thus the novelist whose story lies before us brings Aristotle on to her title-page. Never before, we may feel sure, has the old philosopher found himself in an equally strange place. In a few pages after the opening scene we come upon the description of a farmhouse on the west coast of Ireland. Here an observation of Cicero's is given with an evident air of satisfaction. By the fortieth page the time has come for describing the beauty of the heroine. But beauty in particular must be first prefaced by a dissertation on beauty in general, and so in one short passage of three lines Ovid, Theophrastus, and Shakespeare are all dragged in—shovelled in, we might with full propriety say. As, however, "her nose was pure Greek," we do not feel that our author keeps the balance at all true in the writers whom she quotes. From Greece at least two out of her three authorities should have come, and not only one. It is not only she who quotes, but she makes all her characters quote also. From Aristotle to Longfellow their range of reading lies. Even the villain from Australia, who turns up to break into a house and steal a will, is as ready as the rest. There is now and then a want of accuracy in the citations, as, for instance, when the heroine is described as being "cribbled, cabined, and confined," or where the well-known line from *Richard II.* is given as—

For heaven's sake, let us sit upon the ground.

It is somewhat too bad, moreover, of "an intrepid young man" to open an attack on his worldly mother by saying "the world may be 'given to lying,' as Shakespeare tells us." There is surely some little difference between a writer of plays and his characters, and not all the maxims that Falstaff lays down are to be brought in with the weight of Shakespeare's authority.

Of the story itself we find it by no means an easy task to give any clear account. In fact, however fast we tried to read it, we were not able to reach the end of each volume in time for us still to retain in our memory the beginning. A young lady of our acquaintance who picked up one of the volumes fairly enough described the book by saying that the characters seem to do little but quote, drink afternoon tea, and propose. She, however, was rather fortunate in the passages on which she lighted. The same degree of interest is not kept up throughout. The villain, as a villain, is far duller than even the quoters, the tea-drinkers, and the proposers, though in all these three capacities—for in all he figures, we believe—he is about up to the rest. Though we at once forgot, as we have said, almost all of the story that we were successful enough to make out, nevertheless, finding how the matter stood, we were prudent enough to take somewhat full notes as we read on. Thus, by turning to them, we find that not only had the heroine a nose that was pure Greek, but, moreover, that "her beauty was too great to be deniable." Her mouth, if large, was gracious; while the colour of her eyes grows black and purple as doth the dome above us. Let not the reader for one moment imagine that this strange change in the colour of her eyes was in any way due to the disturbed state of Ireland. The scene of the story is indeed laid at the present time and in the disturbed districts, and both she and the hero have pistols and guns pointed at their heads. Nevertheless, purple and black though her eyes grew, it was not from the blow of a shillelagh, or even of the fist of a Land Leaguer. These wonderful eyes later on are described as being "sombrous," whatever that may mean. It is not an English word; possibly it may pass muster

in Ireland. In another passage we read that her lips lose their lachrymose look. The hero, we believe, has a description of his own somewhere or other in the book, but at this moment we cannot lay our hands on it. Let our readers rest assured, however, that he looked very much as the third son of a baronet who had a nice little independent estate of 1,500*l.* a year of his own would look and should look. He falls in love with Mona, the heroine, and she falls in love with him. The reader detests them both equally long before the love-making is done. At first the hero plays the part of the Lord of Burleigh. He does not let the farmer's daughter suspect that his eldest brother is a baronet. "Some inward feeling prevents him." The sillier the novel the more, by the way, are the characters troubled by these inward feelings, this instinctive knowledge, and these intuitions. "Tell me about your mother," Mona one day says. By that question she strikes a chord, we read, that presently flings harmony to the winds. When she hears that her lover's father had been a baronet, she grows quite pale, and slips off the stilo on which she had been sitting. A quarrel begins, and many pages of fresh twaddle are straightway written. The lovers separate, but meet again the next day. She is engaged in making up pats of butter in the dairy. They show at first signs of a reconciliation, but she suddenly becomes obstinate. He rises, "and moves towards the door with 'pride in his port, defiance in his eye,' as Goldsmith would say." This second quarrel, we strongly suspect, was simply brought about in order to give the author a chance of her quotation. At all events, with the quotation the quarrel at once closes, and the young people fall to kissing. We wonder, by the way, whether a sombrous eye that grew black and purple could ever have defiance in it. Probably not, and hence, no doubt, the reconciliation was much more speedily brought about. He exclaims, "Now let us talk no more nonsense," which certainly was very unfair towards the author, who has still more than two good volumes on her hands which must be filled somehow or other. A mysterious will, however, goes a good way in helping out the story. Where it fails there are a few Irish ruffians and the villain from Australia. Moreover, as an attempt is made to murder the heroine, the hero at once marries her, and then has to make his wife known to his much-dreaded mother, the dowager baronet's wife. This lady is thus introduced to us on the day on which the news has reached her of her son's marriage.

The urn is hissing angrily, and breathing forth defiance with all its might. It is evidently possessed with the belief that the teapot has done it some mortal injury, and is waging on it war to the knife.

The teapot meanwhile is calmly ignoring its rage, and is positively turning up its nose at it. It is a very proud old teapot, and is looking straight before it in a very dignified fashion, at a martial row of cups and saucers that are drawn up in battle array, and are only waiting for the word of command to march upon the enemy.

But this word comes not. In vain does the angry urn hiss. The teapot holds aloft its haughty nose for naught. The cups and saucers range themselves in military order all for nothing. Lady Rodney is dissolved in tears.

It takes our author many pages of hard writing before she can fairly get her heroine into the presence of this awful owner of the teapot with the haughty nose. For such a scene a great deal of preparation is needed. At last, however, the bride reaches the brilliantly lighted hall of the ancestral mansion. The footman goes forward to announce their arrival, and her husband takes advantage of the moment to examine her critically beneath a central swinging lamp. At all events, on this important occasion her eyes are all that eyes should be. They are neither sombrous, nor purple and black, but simply great and blue. Her hair, if a little loose, was eminently becoming. But the owner of the haughty-nosed teapot, a very tall statuesque woman, in spite of her sweet silvery voice chilled the girl's heart. However, she presently picked up a little spirit, for a young lady clad in some soft pale shimmering stuff—what in the name of Heaven is shimmering stuff?—gave her a warmer welcome, though her voice was *trinitite*. Still her life was not at all happy, so much was she snubbed, till at length, we are told, like a timid snail she recoiled sadly into her shell. There she might have stayed had not a Duke and a Duchess appeared on the scene, and taken her part. On one occasion when she was snubbed "the Duchess with a grave expression looked at Lady Rodney," the cruel mother-in-law, who owned the teapot that held aloft its haughty nose for naught. The Duke went still further, and bestowed on the heroine all the attentions which a virtuous Duke could properly bestow.

"Give you my word," said the Duke afterwards to a select assembly, "when she looked at me then out of her wonderful Irish eyes, and said all that with her musical brogue, I never felt so small in all my life. Kerp'lar went into my boots, you know, and stayed there. But she is, without chaff or that, she really is the most charming woman I ever met."

The heroine before long discovers the long-lost will, and successfully defies the villain, who first threatened her with a pistol and then threatened her husband with a dagger. Everything goes smoothly in the end. The villain shoots himself, and a proper number of young people get married. Even Lady Rodney melts at last, and as the reader takes leave of her and the story he sees a remorseful light kindle in her eyes. Why could she not, by way of peace-offering, have made her daughter-in-law a cup of afternoon tea out of her own famous tea-pot? What a fine contrast, as the curtain fell, might have been seen between its haughty nose and the pure Greek nose of the heroine on the one hand, and the eyes, with the remorseful light in them, of the dowager-baronet's wife, and the sombrous, black and purple, great blue eyes of the Irish farmer's daughter, the favourite of a Duke and a Duchess!

* *Mrs. Geoffrey*. By the Author of "Phyllis," "Molly Bawn," &c. 3 vols. London: Smith Elder & Co. 1881.

TWIXT GREEK AND TURK.*

IF any one is so sanguine as to think that the question of the future of Thessaly, Macedonia, and Epirus is simple and readily to be solved, and if he wishes to remain in a condition of ignorant bliss, we advise him not to open Mr. Chirol's book, *'Twixt Greek and Turk'*. But whoever desires to have a brief, intelligible, and amusing account of the state of these distressful countries will scarcely find a better exponent than our author. He seems perfectly disinterested and impartial. He is not a Philhellene, or a Bulgarophile, or an ardent adorer of the Wallachs, and, if he recognizes good qualities in the Turks, he has little pardon or pity for their Government. Mr. Chirol is, to be sure, a great hater of Mr. Gladstone. But his dislike of that statesman seems partly to be due to the fact that the Naval Demonstration was unpopular with official Turks, and so Mr. Chirol could not obtain a *Bouyourouldu*, or passport, from the Porte. He therefore attached himself to a not unspeakable travelling Pasha, a very good fellow, though a poor sportsman, and in his company went from Volo to Larissa.

The northern provinces of Turkey in Europe are, according to Mr. Chirol, in a state compared to which chaos is orderly. The last embers of the old wars of religion are glowing hotly, and not less fiercely burn the first flames of the new wars of science. Macedonia, Thessaly, and Epirus are the homes of broken clans, ready to cut each other's throats about a creed, and equally eager to do some fighting for a new semi-scientific theory of race. It is a country of brigandage, cooked statistics, excommunications, vampires, archbishops, and pashas. On every one of the marches the more enterprising natives have taken to the hills. There are brigands of every caste and class; but the Greeks are the most pious, the most truculent, and the most inventive in abominable combinations of lust and bloodshed. Civilization has just reached the point at which Greeks, Turks, Bulgarians, Albanians, and Wallachs have learned to produce fraudulent returns of population, for the purpose of proving that members of their own race and religion are in the ascendant, and have the best claim to the consideration of Europe. We shall endeavour briefly to explain the confusion of creeds and nationalities. In Macedonia you find Turks, Greeks, and Bulgars, Jews and Wallachs. The pretty little city of Monastir, "at the foot of the defile which leads from Macedonia into central Albania," is a good typical illustration of the blending of races. "With a population which certainly does not exceed 35,000 souls, and which some put down at little over 25,000, it boasts nearly a dozen different communities, with separate aspirations, separate interests, and separate hatreds." There are Bulgarians who have joined the Bulgarian schism, and this schism is the great trouble of the Greeks and their Church. The pliant and tenacious Greeks, during all the years of Ottoman sway, managed to keep on some sort of terms with their tyrants, while they never absolutely lost hold or hope of liberty and of education. Thus the Greeks were the leaders of all the non-Mussulman peoples, and though probably outnumbered by Bulgars, managed to keep the Bulgars within the fold of the Orthodox Church. This state of things lasted till the Bulgarians were informed by professors, or discovered in their own consciousness, that they, too, were members of an ancient race, and of an oppressed nationality. The "pride of race" awakened in them, and it shows how vain a creature is man, that persons should be proud of being Bulgars. They resolved to keep as much of orthodoxy as they could, and so "hedge" as regarded their valuable souls, while, in all spiritual and temporal matters, they broke with the Greeks and their Church. This is the Bulgarian schism, which, according to Mr. Chirol, is waxing rapidly. In vain do orthodox Greek brigands, the most devout of men, threaten Bulgarian villages with fire and sword if they desert the Church. In vain do Archbishops multiply excommunications. The Bulgars have found out that, as in the famous case of the Jackdaw of Rheims, "nobody seems a penny the worse." Nay, the impotent excommunications of the Orthodox prelates have even caused vampires to be spoken of with scepticism and derision. The notion used to be that excommunicated people became *Vrykolakas*, or vampires, and wandered about sucking the blood of men. There were families in the village which claimed descent from vampires, and could mediate between their living neighbours and their dead relations. But so many people have been excommunicated in Perlepe, for example, because they have joined the Bulgarian schism, that vampires have grown familiar and nobody fears them. When threatened with excommunication a Bulgar now merely grins, and says, "Ah, well, I suppose we shall all be turned into *Vrykolakas* some day. The more the merrier." So the *Vrykolaka* is exploded, and the unlucky families who claimed connexion with him gradually give up their sackcloth and ashes, their dishevelled locks, their nocturnal spells, and all the rest of their stock in trade, and sink down from their supernatural estate to the dull level of common labouring humanity.

Here, then, is one element in the political and spiritual chaos—namely, the Bulgarian schismatics. Next you have people, Bulgarian by race and by political sympathy, who still fear becoming vampires, and therefore still cling to the Orthodox Greek Church. But it is probable that this class will rapidly

diminish in numbers and importance. Next, there are Bulgars who "Hellenize," speak Greek rather than Bulgarian, and throw in their lot with that of the Greeks. But this is a very small section of the population. The pure-blooded Greeks are still more rare. Then, many of the Wallachs speak Greek, but others are Wallachian in sentiment, and wish Greeks, Turks, and Bulgars at the devil. They say "We are Wallachs, *Roumounoi*." Some thirty years ago the Moldo-Wallachs had a very bad reputation in Western Europe. In a French play, or novel, a young man of this interesting race proposed for the daughter of a Parisian *bourgeois*. The old gentleman asked the would-be son-in-law about his country and kin, and then sighed, "*Si jeune, et déjà Moldo Valaque!*" But now the Northern Wallachs are called Roumanians, have proved they can fight, and have a king, and everything handsome about them. The Southern Wallachs, also *Roumounoi*, and descended in some way from Roman colonists, look lovingly at their kinsfolk across the Danube. They do not see why Greeks or Bulgars of either rite should inherit the lands that are slipping from the grasp of the True Believers. Meanwhile the True Believers themselves are by no means united, even in a little town like Monastir. There are Albanians among them "who still hold with the Porte, but the greater number look only to its support as the means to an end—the vindication of their own independence." The Albanians have read or heard of M. Benloew and his famous, and we venture to think funny, book, *La Grèce avant les Grecs*. M. Benloew's arguments remind us of those by which Chinese are proved to be Chaldeans; New Zealanders, Egyptians; Niobe to have been a Hittite; the Irish to be Phœnicians; and the English—Jews. "The philologists settle everything," as Sir William Jones grumbled long ago, and M. Benloew has settled it that the Albanians are Pelasgians. The cry "Pelasgia for the Pelasgians!" if successful would give the Albanians the south from the Pyrenees to the centre of Asia Minor. But at present the Albanian League would be content with a smaller award. Meanwhile, we have four or five interesting little nationalities, without government, education, money, or anything but confidence, squabbling for a territory still in the hands of a decadent Power, and surrounded on every side by nations both vigorous and hungry—land-hungry. Land-hunger is a noble appetite, and should be gratified in any one but an Irish landlord; but who is to gratify all these various claimants? How can the Balkan peninsula possibly be divided among its populations? Is every town and village to fall, after a quadrangular duel, into the hands of the stronger and pluckier section of its inhabitants? That would not suit the Greeks, while the aspirations of the Wallachs seem unlikely to be satisfied, and just at present the most patriotic Bulgar might think twice, or even thrice, before throwing in his lot with Bulgaria.

Mr. Chirol has travelled among all these queer tribes and studied them at home. He has seen how readily people take to liking each other, in spite of differences of creed and race, when priests and agitators leave them to their natural impulses. He has found Greek bishops and Turkish pashas of the right sort on the most friendly and even affectionate terms, while Christian lasses danced with Turkish officers at the ball which followed a bridal ceremony. But the Greek priesthood, as a rule, make religion the stalking-horse of political ambition. Mr. Chirol's sketch of Yanina, which the Greeks so ardently and naturally desire, and which the Turks are so loth to part with, is perhaps the best chapter in his book. Yanina is the daughter of Dodona, of the oracle of the Pelasgian Zeus, the seat of the Selli, whom Mr. Gladstone supposes to have preserved that famous "primitive tradition" in which the Christian Trinity and the Virgin Mary are mixed oddly up with Apollo, Athena, Zeus, and Leto. "There is little doubt," says Mr. Chirol, "that, when religions and political revolutions wrought the destruction of Dodona, it was the inhabitants of the sacred city who, driven from their homes, founded the town of St. John (*Ioánnina*), on the fertile banks of the lake which now bears its name; and during the five centuries of Turkish rule, when Athens and Corinth were mere Turkish villages, the descendants of the Hellenes have never ceased to resort to the schools and colleges of Yanina, even as their ancestors had flocked to the national shrine of Dodona." Even the Mussulmans in this district have little Asiatic blood. But they, like the intelligent people everywhere, dread Greek bureaucracy almost as much, or even more, than the impotence and greed of Constantinople. That impotence and greed permit anarchy and cause provincial bankruptcy by draining Thessaly and Macedonia of men and money. Mr. Chirol has no doubt that "the old Ottoman Empire—the Mussulman theocracy—is doomed, on this side of the Bosphorus at least." We quote, as a proof of Turkish decadence, Mr. Chirol's description of the financial condition of Thessaly:—

Thessaly, as I before stated, is one of the richest provinces of the empire. In good years its crops of wheat, barley, Indian corn, and tobacco alone represent more than a million sterling. The tithes and muttons (as the tax on live stock is called) bring in 200,000 *liras*, and the local expenditure has been cut down within such narrow limits that the provincial revenue shows an annual surplus of 250,000 *liras*. Yet withal, the province is practically bankrupt. Constantinople devours all its wealth, and leaves to it only the burden of its debts. The sale of Crown property has been going on briskly since last summer. The principal purchaser has been Abram Pasha, the agent of the ex-Khedive at Constantinople, who is rapidly becoming one of the wealthiest landowners in Turkey. Large estates have also passed into the hands of native Greeks, as well as of Greeks from the Hellenic kingdom. Nearly half a million has been paid by the purchasers, but the provincial exchequer remains empty as heretofore, for the Porte swallows up every farthing of the purchase money. To Government con-

* *'Twixt Greek and Turk: Jottings during a Journey through Thessaly, Macedonia, and Epirus in the Autumn of 1880.* By M. Valentine Chirol. London: Blackwood & Sons. 1881.

tractors alone the authorities at Larissa owed in October last 150,000 *liras*; and so absolutely had the uncertainty of the political situation and the unscrupulous financial measures of the present Grand Vizier destroyed the last vestige of local credit, that, instead of selling, as usual, the proceeds of the tithes (which are collected in kind), the Government was obliged to keep them in store in order to have wherewithal to feed the troops. Already maize was being served out to them in lieu of rice, because the contractors refused to renew the supplies on any terms save cash, and cash there was none to give.

In addition to its political and economical interest, Mr. Ohiorl's book contains many pleasant pictures of travel. But we wish he would not talk of *bond fides*, and he may mislead the *Daily Telegraph* into its old celebrated blunder if he speaks of "Milo's Venus." Milo was not a sculptor, but an athlete.

THE OCCULT WORLD.*

IT is the proud privilege of the present age that we are emancipated from all the childish superstitions of our forefathers, and that we can laugh at the fairies, elves, witches, imps, familiars, demons, genii, and other *bizarre* creations of old-world fancy. It is true that an impartial outsider might be somewhat chary of accepting this statement, and might point to the existence of beliefs concerning supernatural agencies, which bear a most suspicious resemblance to those which make our ancestors appear so foolishly credulous in our eyes. But this is only a coarse and unscientific manner of viewing the matter. The fact is, we are assured, that the hitherto undeveloped or hidden powers of nature are now becoming better understood, and what was once necromancy or magic is now magnetism, odic or psychic force—something scientific, in fact, which learned doctors may investigate in their intervals of leisure as a relief to the monotony of physiology and deep-sea exploration. This is all very satisfactory, because it would really be a cause for regret if the leaders of modern thought still hankered after visionary wonders of the alchemy type, or, worse still, if they were the willing dupes of unprincipled adventurers, and were induced to regard the three-card trick as "a curious phenomenon of unconscious cerebration in a hypnotic patient," to use the favourite jargon of such discussions. Being ourselves scientifically unregenerate and unable to see anything but clumsy imposture and fatuous credulity in the exhibitions—we beg pardon, experiments—of modern thaumaturgists, it gives us all the more pleasure to be able to call attention to the last new phase of "occult" research, and to put the learned observers to whom we have referred upon the track of the true nature of the mysterious forces in question—to send them, in fact, to headquarters for their information. The new light comes from the East, and the torch-bearer is Mr. A. P. Sinnett, a gentleman well known to Indian journalism. We will first state his case without comment, reserving our remarks upon the alleged facts.

The averment is that there is a school of philosophy still in existence of which modern culture has lost sight; and that, while modern metaphysics and modern physical science "have been groping for centuries after knowledge" occult philosophy has enjoyed it in full measure all the while. The natural tendency, as Mr. Sinnett allows, has been to conceive that the occult philosophers of old—Egyptian priests, Chaldean magi, Essenes, Gnostics, theurgic Neo-platonists, and the rest who made a mystery of their knowledge, did so because they knew very little and there was consequently very little to conceal. The researches of M. Lenormant and others, and the decipherment of ancient Egyptian and Assyrian magical formulae, certainly favour this idea, for Chaldean magical hymns and the like read like arrant nonsense; but Mr. Sinnett knows better:—"Men of science in former ages worked in secret, and, instead of publishing their discoveries, taught them to carefully selected pupils," and the wonderful "mysteries" of ancient times have been transmitted by secret initiation to men of the present day. Magic, in the ordinary sense of the word, does not exist, but magic in the sense of the science of the Magi is, we are told, quite a different matter, and we ought to have no hesitation in accepting its wonders. It was already a complete system of knowledge that had been cultivated in secret and handed down to initiates for ages in the days of ancient Egypt and Greece, and the adepts of "occultism" are even now able to perform miracles surpassing those recorded of the wonder works of antiquity, and proving them immeasurably further advanced than modern science in comprehending the laws of Nature.

But it is not merely in physics that "occultists" have made such startling progress. "Modern science has discovered the circulation of the blood; occult science understands the circulation of the life-principle. Modern physiology deals with the body only; occultism with the soul as well"; the existence of the soul adepts prove by the simple experiment of parting it from the body and examining it as a separate entity. On this "projection" of the soul Mr. Sinnett grows eloquent, bringing in by way of argument or exposition references to St. Paul, chemistry, and captive balloons. Occultism will have "no connexion with the establishment over the w.y." Spiritualism; it certainly does manifest its mighty powers in much the same futile manner—by the familiar "rap," the sixpennyworth of cut flowers, and the "direct writing"; but these are not brought by spirits; they are

"precipitated" by a "brother," who generally takes the trouble to leave his hermit retreat in the Himalayas in order to be present, "in astral body," at the meetings of the Theosophical Society—not *demons* be it observed—in order to show these little conventional courtesies of the supernatural world. The author of *Zanoni* and *A Strange Story* appears to have had more than a cursory knowledge of occultism, and the sublime personage in the background of the first-mentioned story is clearly a great Eastern adept of the science. Though, why Lord Lytton should have cast his information in the form of a novel, rather than of an authoritative statement, Mr. Sinnett cannot understand. The same distinguished writer, in his *Coming Race*, also incidentally reveals another secret of the art—namely, the potent force called *wil*, which is identical with *akas*, the force employed by "occultists." These occultists form a mysterious brotherhood, or secret association, which has branches all over the East, but has its chief seat in Thibet. Anybody may apply for admission to the order, with a chance of being received into it; but he has first to find out one of the mysterious brethren, to whom to apply; then he has to go through a probationary course of years of trials and asceticism; and, lastly, he must submit to an initiation, the perils of which are so appalling that Mr. Sinnett considerably refrains from any mention of their nature.

There is, however, a means by which the inquirer can obtain access to the mysterious brotherhood, and that is through the Theosophical Society of India, whose foundress and president, Mme. Blavatzky, is, though not an adept, an advanced neophyte in "occultism," and is on "astral" speaking terms with all the principal adepts, and even with the great head-centre himself. It was through this lady—a Russian by birth, but an American citizen—and through her assistant, Colonel Olcott—also an American—that Mr. Sinnett made his first acquaintance with the occult world. In order to demonstrate the existence of the "brothers" and the miraculous powers which had been conferred upon herself by them, she exhibited several very edifying feats, which appear to have impressed our inquirer in an extremely solemn manner, but which do not seem to us either very new, or even, as told by the thoroughly mystified writer, very extraordinary. They consisted chiefly of producing raps on tables and on bell-glasses, of sending cigarettes on journeys round the room, and of producing missing articles from odd places at odd times. A crucial test which Mr. Sinnett asked for was the production in India on any given date of that day's London *Times* newspaper; but it was "precisely because it would close the mouth of sceptics" that the test was declared inadmissible. It always is! The world is not ready for such displays at present, and must be content with raps and cigarette papers as indications of the working of higher powers. It appears, then, on a careful perusal of the evidence adduced by the writer, that his acquaintance with Oriental adepts in occult science was entirely second hand, and that the mediums in this case, as in that of most spiritualistic manifestations, hailed from America. They placed Mr. Sinnett, it is true, in correspondence with one of the mysterious Thibetan brotherhood, named Koot Hoomi Lal Sing (which, by the way, may be roughly translated "Magic-circle-sacrificial-Jack"), an occult hermit of the Himalayas, whose epistles are given in full. They are written in very choice American, and the Oriental lore which they contain is exclusively derived from a perusal of Lord Lytton's novels, and of a mystical jumble entitled *Isis Revealed*, published some years previously by Mme. Blavatzky. It is curious to observe how much of their knowledge departed or sublimated Eastern spirits owe to European literature. We remember reading the autobiography of a Persian Prince of the Sassanian dynasty which was revealed to the "Prophet Harris." The deceased fire-worshipper, who lived a century or so before Mohammed, called himself Hafiz, which means "one who knows the Koran by heart," and which, by a strange coincidence, is also the name of the Arab-hating, anti-Mohammedan Persian patriot of Moore's *Lalla Rookh*.

Following Oriental custom, we will ourselves relate a little apologue appropriate to the subject, which has the additional advantage of being true. Two merry undergraduates who were in town at the time of the University boat-race found themselves in Regent Street at early dawn, when that thoroughfare was tenanted only by a hand-cart and an intoxicated billiard-marker. To put the latter into the former and run him swiftly along was the natural act of impulsive youth; but the apparition of a policeman upon the scene caused them suddenly to abandon this congenial amusement. The cart, having acquired considerable momentum, overturned upon the pavement, and shot the drunken person out at the constable's feet. "What are you doing in that cart?" sternly demanded the officer. "Cart, yer stoopid!" replied the other, "I never see no cart!" This is precisely the frame of mind of your enthusiast in occult phenomena. He is hurried along by mischievous impulses from outside, while his own mental faculties are so obscured that he cannot perceive the tricks of which he is the victim. The experiences of such persons are very pernicious when related, for as they fail to see or will not acknowledge the obvious explanation of the phenomena they describe, their accounts of the "miracles" which have converted them often lead others astray. The real "scientists" of the present day are not without blame in the matter, for when the unlearned public hear of men whose learning they have been taught to look up to and respect condescending to investigate the tricks of common charlatans, they are apt to think there is something, after all, in any "occult"

* *The Occult World*. By A. P. Sinnett. London: Trübner & Co. 288s.

doctrine, however extravagant it may be. Mr. Sinnett writes in perfect good faith, and *The Occult World* contains much that is curious and amusing; but we trust the credulity of the public is not to be gauged by his own as exhibited in the book.

ART AND ARCHEOLOGY AT OXFORD.*

ALMOST all English students of art are familiar with the Fitzwilliam Museum at Cambridge. It is easy to run down from London by an early train, and return the same day, having seen the object or class of object you are engaged in studying, without fatigue or delay, whether it be pictures, or sculpture, or prints, or illuminated manuscripts. The things are all arranged, and are all together in one place. Unfortunately there are few similar examples in England; for though a great improvement has taken place in this respect of late years, few things strike the inquiring foreigner more than the absence of public collections in provincial towns. All Italian, most French, and many German cities have their galleries, their museums, their collections of works by local artists, and, in general, a statue or two commemorating some painter or sculptor whose fellow-citizens are proud of him. But in England not many years ago you had no chance of seeing a picture, or a statue, or an antiquity except by visiting some show place and examining its private collections. Now there are excellent museums and galleries in several large towns, such as Liverpool and Sheffield. Archaeological Societies have preserved local remains and formed museums, as at Warwick and Canterbury and Maidstone. Newcastle-on-Tyne is famous in this way; and so is Nottingham. Even at Colchester there is a museum. Picture-galleries are rarer, and it is only at Cambridge that we can remember to have seen a gallery of exhibited prints. There, owing to the exertions of a single individual, the collections of every kind in the University have been brought together, catalogued and arranged, supplemented and weeded, labelled, and, above all, exhibited. The result is eminently satisfactory to the visitor, and creditable to the University which has thus fulfilled its public duty, and strengthened the hands of a competent, enthusiastic, and energetic professor. Were it not that in a sister University there is a remarkable example to the contrary, one might have thought it strange that the achievements of the Fitzwilliam syndicate needed any notice. Prior to experience, it might be supposed that what has been done at Cambridge would have been done also at Oxford; and that the University would only need to know what was its duty in order to ensure its fulfilment. It cannot be doubted that Oxford possesses somewhere great treasures of art and antiquity. It has pictures and prints and illuminated manuscripts, and old marbles and Egyptian bronzes and ceramics. But where are they? Presumably they are in the Taylor Building and the Ashmolean. Some years ago there was a great fuss made about a new Museum in the Parks. But, so far as the outside public or the foreign visitor is aware, neither art nor archaeology has a place there; and, though some say there is art in the design of the building and its embellishments, others strenuously deny it. That the Ashmolean Museum building is picturesque nobody has ever denied, but it is absurdly small for its purpose, and has, moreover, been encroached upon for other purposes than those for which Wood designed it. The Taylor Building, which in many respects superficially resembles the Fitzwilliam Museum at Cambridge, is not very pretty as an architectural work, and though the Raffaele and other drawings are shown, the greater part of the contents of its shelves and cupboards is absolutely unknown. The story is told of a print collector who, after long and at first futile inquiry, discovered a brown paper parcel containing a priceless but uncatalogued collection of Little Masters, and other suchlike treasures are probably in the same peaceful and undisturbed abiding place.

Mr. Greville Chester, formerly of Balliol, has appealed, in a pamphlet before us (Oxford: Shrimpton), to the authorities of the University to remedy the existing state of things. Mr. Chester expresses himself no doubt too warmly, but it is easy to understand that, in common with other eminent archaeologists, he should be betrayed into bitterness of spirit at what he sees. On nothing, he asks, be done to consolidate the various collections? "Not even the most bigotted admirers of the *status quo* can think that their present condition is creditable to Oxford as a place of learning, while all archaeologists must regard it as simply disgraceful." This is the text of the whole pamphlet. It will not further Mr. Chester's case to have stated it so strongly; the case itself does not need such treatment. The mere facts, temperately put forward, should bring a blush upon whatever may be held to answer for the University cheek. It is useless to expect gifts of objects or bequests when little which the University contains is at present exhibited, and, according to Mr. Chester, nothing is arranged. The archaeological collections are five in number, or, to speak more correctly, the ancient objects are divided into five collections, "to the great injury of each." The largest and best is on the ground-floor of the Ashmolean Museum, "erected, at the charge of the University, to contain the collections of Elias Ashmole, given to the University on that condition." In a vaulted room under the Ashmolean, besides the remainder of its proper collection, is a part of "the once celebrated and highly prized Arundelian Marbles, whereof the

rest remain in a small chamber in the court of the Schools." Lately, continues Mr. Chester, the directors of the Natural History Museum—we presume he refers to the New Museum in the Parks—"have commenced a rival collection of antiquities," but they are arranged in so small a space as not to be available for purposes of study. The marbles of the Pomfret collection are "stowed away out of sight and out of mind in the desecrated vaults of the Taylor Buildings, or incongruously stuck about amongst the casts of the Chantry statues." Mr. Pitt in plaster jostles a Roman senator in marble, and a muse in stucco looks down on two Ninevite slabs. "In the Atrium below a white marble bust of 'T. Woodburne, Esq., by Behnes,' surmounts the sarcophagus of a Roman child." Some years ago Chevalier Castellani presented some Etruscan antiquities to the Ashmolean, and a little later the University purchased a further collection of a similar character from the same learned gentleman. It might, of course, have been supposed that the two collections would be brought together into the same place; "but no such thing," exclaims Mr. Chester. "It seemed good to some learned persons in authority to separate what a common origin, epoch, and locality had joined together, and so the second portion is placed in the Taylor Buildings," where it can only be seen afar off, through a glass door, and is unarranged. In the same place are some Oyprian vases, presented by Mr. Ruskin; and the rain was freely dropping in through the skylight when Mr. Chester saw it. "Lastly, there are a certain number of antiquities scarcely suited to a library, but which, with the almost inaccessible cabinet of coins, are preserved in the Bodleian." Besides these things, which are the property of the University, there is, in the Library of Queen's College, a "secret and rapidly perishing collection of Egyptian antiquities," and a cabinet of coins at New College, of which Mr. Chester says that, as they are only to be seen in the presence of the Warden, they are as accessible for the purpose of study as they would be "if buried in the mud of the Tiber or Isis."

Such is the general statement of Mr. Chester's case against the University of Oxford. He adds a large number of examples of the confusion which reigns among the different places of deposit. Thus, while a portion of the Anglo-Saxon remains is in the Ashmolean, another portion is "in the new and rival collection in the Parks." There is similar separation between two parts of a collection of gold earrings and necklaces from Greece. No donor's name is appended to these last; but a card sets forth that they came from "Gurgan." Where is Gurgan? In the Ashmolean are some Egyptian remains, brought, we believe, by Mr. Chester himself, from a mound in the Delta. They are partly concealed by slabs of wood on which are laid photographs of Roman sculpture. The pictures which formerly hung in this Museum have been taken down and packed away in boxes, stored in the Clarendon Building. The most interesting object in the Ashmolean is, of course, the stela, which bears the name of Senda, an Egyptian king who reigned among the Pharaohs of the second dynasty, at a period so remote that some have placed it three centuries before Oration. Will it be believed, asks Mr. Chester, that the other day the written description appended to this venerable monument contained two instances of false spelling? The crowded state of the Ashmolean is caused by the appropriation of the upper chamber for an examination hall, an appropriation which is probably illegal. The vault in which the Arundel marbles are deposited also contains some zoological and other specimens, including a stuffed bullock and some castor-oil beans. A number of valuable objects in silver, amber, agate, and other precious materials, from the celebrated Tradescant collection, which have long been packed away in an outhouse, have been made "the subject of a painful correspondence." The keepership of the Ashmolean, which seems to have been an honorary office till lately, has been endowed by the munificence of Mr. Parker with 100*l.* a year, out of which the assistant keeper and a boy have to be paid. Mr. Chester suggests that the keepership should be annexed to a professorship of archaeology, and complains that the Commission has done nothing in regard to this subject. But before such an arrangement is made for the Ashmolean the University has to endow a chair of Egyptology, which, in common with Cambridge, it still wants. The question of the catalogues also exercises Mr. Chester's mind, and the statement he makes that Mr. Parker has himself, at his own expense, had to get some of them printed, will cause surprise, and, we may hope, shame. Mr. Chester finally recommends the purchase of a few glass cases, the resumption by the museum of the upper chamber, the restoration to light and air of the abstracted pictures, the combination of the various kinds of antiquities, the removal of stuffed beasts from the already overcrowded Ashmolean, and the chronological arrangement of the works of art in the Taylor Buildings. These are not unreasonable requests. The real difficulty is to find some one sufficiently public spirited to sacrifice time and trouble to put things in order. It is likely that a rigid enforcement of laws already in existence would be sufficient. There are probably conditions attached to many of the gifts and bequests from which the collections have been most largely recruited, which, if carried out, would give a reformer great power. A very moderate expenditure would remove from the University what is, even to people who do not go so far as Mr. Chester, a scandal and shame. The treasures in every branch of art and antiquity hidden away at Oxford are probably unrivalled, and it is the manifest duty of the authorities not only to make them accessible, but by their stores of learning to elucidate and illustrate their meaning.

* Notes on the Present and Future of the Archaeological Collections of the University of Oxford. By Greville J. Chester, B.A. Oxford: Shrimpton.

SOME CLASSICAL TEXTS AND NOTES.

MR. PAGE, in his edition of the Second Book of Horace's Odes, keeps as well in view as in the First Book his scope as the editor of an elementary classic; while never wittingly shirking a difficulty, he purveys also food of the simplest shape, enabling the teachable and observant tiro to acquire familiarity with Horace as he proceeds, noting curious uses of words—e.g. in Ode i. 5, "crucioribus" (rare in the plural, but see Verg. *Æn.* iv. 687, "atros siccabat veste cruores," "she kept trying to staunch the stream of blood which kept bursting out afresh"). In that passage, says Mr. Page, the force of the plural is obvious. Here it refers to the several spillings of blood—e.g. at Pharsalia, Thapsus, and Philippi. Elsewhere it is pointed out that in "jam fulgor armorum fugaces Terret equos, equitumque vultus," *fugaces* is proleptic—the sudden flash of weapons in front of them frightens the horses so that they take to flight. Something might be said on the effect of assonance here, but it is more notable that Mr. Page impresses the poet's design to bring vividly into his picture the pale panic-stricken faces of the men he had seen flying for life at Philippi. In the Second Ode, v. 5, "extento ævo" is explained, with an eye to the connexion of "ævum" with *alei*, as not "through long ages," but "with his span of life extended beyond the grave"; and in v. 6 Horace is pronounced to use "animi" as a simple genitive of quality; "Proculcius notus animi paterni" being a short form for "Proculcius illustris" (as being a man) "of fatherly affection." In ii. 22 he hits the certain sense of "propriumque laurum" in seeing that the reward of virtue is a crown "that fadeth not away," and parallels this use by Sat. ii. 2, 134, Ep. ii. 2, 170-6. In Ode vii. 6, "Cum quo morantem sepe diem mero tenei," Mr. Page discards the far-fetched explanations of Wickham and Orelli, and rests on the simple interpretation, "with whom oft have I crushed, or broken the back of, a lagging day by aid of wine." Space is wanting to pluck all the simple flowers of this brief common-sense scholarly commentary, and we have dwelt on it too long already, to do more than notice the sound illustration of Ode xiv. 19, "Damnatusque longi Sisypheus Æolides laboris," where Mr. Page notes the discrepancy between this construction and the genitive of the charge, explained by "crimine" understood. Here "Longi laboris" is the sentence not the charge, as Livy has *damnatus voti*, "condemned to pay the thing vowed" (Cicero, *Verr.* ii. 3, 11.) We can assure our readers that the more they study these lucid notes, the sounder will grow their scholarship.

It is a labour of love which Messrs. Rivington have accomplished in their neat-typed reprint of the *Bucolus, Georgica*, and *Æneid* on the basis of Ribbeck's text, on a scale for eyes past their first keenness of vision. Open it where we will, each page exhibits some discrepancy from other variant readings—e.g. in the Second Book of the *Æneid*, this text places a period after "dolorem"—at the end of v. 3 "Infundum—dolorem"—and so connects all between "ut opes" and "magna fui" with "quis talia fando Temperet a lacrimis." Again at v. 75 this text retains, in place of "Quidve ferat, memoret" (Heyne's reading and pointing), Ribbeck's conjecture, characterized by Conington as "unhappy," "Quivo fuit, memores quæ sit," &c. At 138 of the same book "Nec duplices natos" is adopted by Ribbeck for *dulces* as a reading mentioned by Servius, and found in Pal. a. m. p., and once more, at v. 346, where Cœcilius is described as

Infelix qui non sponsæ præcepta turentis
Auduit!

we are glad to find that Ribbeck's sympathies are with the *subjunctive*, though several MSS., and among them two of his cursives, have *auduit*. The edition will be valuable in a textual point of view, and charmingly handy.

We cannot find in Mr. Litting's *Myths from the Metamorphoses, told in English*, anything novel in idea or execution. The author has seemingly taken fifteen of Ovid's mythic tales, tacked a moral to each, and then gone about to imply that others are understood beside those expressed. Deucalion and Pyrrha, Phaethon, Pyramus and Thisbe, Atlas, Andromeda, Orpheus, Andromeda, Atalanta, Orpheus, and half a dozen others, are the tales which Mr. Litting has set before uncritical readers *currente calamo*, and without much research or much indebtedness

to the Latin. The venture strikes us as superfluous, when the young reader has already such preparatory helps as Blackwood's *Ancient Classics for English Readers*, and Professor Church's *Stories from Homer, Horace, Virgil, the Tragic, and Herodotus*, which furnish a faithful reflection of the Greek and Latin masters. Although where in X. Orpheus, pp. 67-71, Mr. Litting diverges into poetry, and varies his prosaic rôle by a set of stanzas imitative of Pope's Ode on "St. Cecilia's Day," he to some extent enlivens his matter, we cannot say that he is equally successful when he prints for the finale of the myth of Phaethon the inscription of the Hesperides on his tomb:—

Phaethon lies buried here;
Of sun-god's car the charioteer
He needs must be;
In vain the mighty feat he tried,
For in the great attempt he died
Lamentably.

A far more practical and distinct help to modern scholarship is given in the other volume which comes to us from the press of Messrs. Newman and Co., and presents the etymologic notes of Mr. Williams, a former Scholar of Trinity, on the Fourth Book of Ovid's Pontic Epistles. With a tenacity highly creditable, he follows Mr. Roby's lead in explaining all the more noteworthy phases of the subjunctive mood, and according to his limits deduces from his text the principles of comparative philology. Those who have not studied Ovid's Pontic Epistles will recognize the wisdom of the selection of the Fourth Book for thus illustrating, and find in the Epistles of Ovid to Sextus Pompeius (i. iv. v. xv.), to Severus (probably the epic poet named by Quintilian, I. O. x. i. 89), and to an anonymous faithless friend (Ep. iii.) ample field for gathering fresh proofs of Ovidian variety and easy versatility. In the First Epistle (17-8), "Da mihi, siquid ea est, hebetantem pectora Lethen"—"Grant me, if there be such a thing, 'a Lethæ steeping breasts in oblivion, still, I cannot forget thee.'"—Mr. Williams points an instance of the current unbelief in the old mythology among the educated Romans of Ovid's day, and later on, at v. 28, "Quod fecit, quisque tuctur opus," the poet is shown to compare his own connexion to Sextus Pompeius, his patron, with that of their respective masterpieces, to the famous artists of antiquity, and imply (as in v. 2, "debitor vitam") that he owes his existence as much to Pompeius as they theirs to their makers. On i. 29, "Artificia Cui" is of course Apelles, though strictly perhaps a native of Colophon, and in the reference to his Venus Anadyomene "Arcis Actææ," in 31, stands for the Acropolis at Athens, where, as Mr. Williams shows from Wordsworth's "Greece," were three statues by Phidias of Minerva, one of ivory and two of bronze. In vv. 33-34 the context points the right sense of the second line—

Vindictæ Calamis laudem, quos fecit, equorum;
Ut similis veræ vacca Myronis opus.

"As Calamis" (a famous sculptor, contemporary with Ageladas, the master of Phidias) "claims the praise of the horses he wrought; and as the life-like cow is Myron's work, so I," says the poet, "not the least part of thy property, regard myself as the work and task of thy protection." In the Second Epistle the poet shrinks from replying in poetry to Severus, because poetry, so far from being a gain to him, had been the source of all his trouble, and "because to write a poem which you can read to no one is the same as dancing in the dark"—cf. v. 33. In the 26th verse of the Third Epistle the first word, "venisset," is rightly explained as "venire debuit," the passive subjunctive of Roby, § 1604. In all but its attention to comparative philology, however, Mr. G. H. Hallam's edition of Ovid's *Fasts*, the work of a Harrow master educated at Shrewsbury, is the completer book of the two. Written for young boys, it is accommodated also to the uses of elder readers. Grammar difficulties have been carefully dealt with, as well as those of mythology and antiquities, and in the appendices Mr. Hallam has acted on Professor Mayor's hint, and collected a number of instances of the less common constructions and grammatical usages found in it. Using generally for his text Merkel and for his work Herig, Keightley, Paley, and Professor Ramsay's selections from Ovid, he has produced a work handy as Paley's, and, it seems to us, more copious, if less critical. Without seeking further than the poet's conversation with the early deity Janus (62-310), we glean an insight into the store of various erudition with which these notes are replete—e.g. on i. 75, "Et sonet accensis spica Cilicis focis?" "How the pistil of the saffron plant (best grown in Cilicia) crackles if thrown on the lighted altar, and so is a good omen"—a bit of folklore applied to nuts in Burns's "Halloween." The white oxen of Clitumnus are quoted from Macaulay for the "Herba Falsica" of 84. The patent derivations of Patulcius and Clusius are traced in note to v. 129; and in that on 136 we see why, according to Ovid, Janus, like every *janua*, has two faces, one looking at the outer world (*populum*), the other (*Larem*) the household god (136). In 165, &c., we are taught why New Year's Day is not a holiday, and get the exact sense of *deibat*—gets a taste of work by practice; and at v. 189 find the ancestry of New Year's gifts in gilded date palm, fig, honied sweets, and the small brass coins which the Romans called *strenæ*, and the French *étrennes*. As might be expected, the poet's derivation of Latium from "latente Deo," because Saturn in exile lay hid there, is set right by the philologist's connexion of the word with *πλατὺς*, the broad plain, π having dropped out. We can promise an agreeable guide to the poet's teaching and its setting right in Mr. Hallam's pages.

A favourable opinion has been already pronounced on Mr. Pretor's careful editing of the earlier books of the *Anabasis*, and he

has evinced his wonted acumen and critical skill in the Seventh Book, which concludes the work. The prefatory analysis may be consulted with advantage, as too may Grote's "Greece" (vol. xi.) and Sir Alexander Grant's "Xenophon for English Readers" in Blackwood's Series.

Dr. Holden's co-operation with the German editors, Wunder and Köpke, to arm English students and public schoolboys with a thorough edition of Cicero's oration for *Gnaeus Plancius*, deserves warmer approval than our space can accord. With but one or two marked exceptions it is one of the most interesting of the specimens preserved to us of Cicero's oratory, and its bearing on canvassing, electioneering, political tactics, and the use of the ballot at Rome should have justified long ago its edition in the Pitt Press Series, by a scholar as great with Cicero as he is with Aristophanes. Dr. H. A. Holden will be found to have fulfilled his task in such wise as to have slurred no difficulty, left no authority unconsulted, called to aid a sound choice of grammars, and furnished his introduction with all the information on "ambitus," "sodalicia," "coitio," and similar technical terms as have to be continually recurring in the course of this most attractive oration. In p. xxxvi. it is clearly defined that "sodalitates" or "collegia sodalicia" as would be the title in full, were brotherhoods for feasting and sacrifices belonging to the same temple-worship, and "collegia" associations of experts to maintain the traditions of their calling, or of the lower ranks to propagate their political views. Dr. Holden makes it plain in § 24 what was the *crimen sodalicii* which formed the *actio d'accusationis* of *Gnaeus Plancius*, and we need but direct the student to the commentary on the chapters of the text, to introduce him to an exhaustive and lucid account of the whole action before the Indices, and make him fully acquainted with all the points and niceties of the case. Without attempting an analysis of Cicero's speech, which is said without any certain ancient authority to have procured Plancius's acquittal, we may draw attention to a *locus classicus* in c. ix., illustrating the orator's high-flown compliments to the Publicani, or "farmers of the public revenue," of whom Plancius's father was one, and who as a body were convertible terms with the *Equites*; and a little after, in the latter half of Chapter x., Cicero's eloquent comparison of the honourable remembrance of the people of Minturnæ with the shelter they gave to Marius in his exile, with the honourable desert of Plancius for according shelter, succour, means of restoration from banishment to himself, Cicero, on the occasion of his exile. An honourable notice should be made of the chronology of Cicero's life (xlvi.-lix.), a valuable appendix on the text; and two indices, one geographical and historical, the other *rerum et verborum*.

For the last volume on our list, the second volume of Cicero's *De Oratore libri tres*, of which the date was the autumn of B.C. 91, we are indebted to the Clarendon Press, which will no doubt have reason to be proud of the work of the Professor of Latin in the Victoria University, when it is completed. The original presents the form of a dialogue between two of the greatest orators of the pre-Ciceronian age—namely, Licinius Crassus and M. Antonius; and the subject deals in the First Book with the studies required for an orator, in the Second with the treatment of the subject-matter, and in the Third with the form and delivery of a speech. Judging by the book before us, we are impressed by Cicero's grasp of subject, ease, and vivacity; and consider his treatise, though lacking the art of a Platonic dialogue, at once attractive and instructive. As, however, the commentary on the First Book, which would have contained Professor Wilkins's introduction to the whole subject, is not to our hand, it must suffice to say of Vol. II. that it quite realizes, what might have been inferred from Professor Wilkins's further undertakings on Latin literature, his copious collateral research, his thorough acquaintance with his *dramatis personæ*, and his steadfast rule of leaving no critical or grammatical question unsifted. A thorough edition of the *De Oratore* would be a boon of price to the scholar and the rhetorician.

BOOKS ON RIDING.

THE simultaneous appearance of three practical treatises on riding is a somewhat strange coincidence. Undoubtedly riding is a subject of great interest to English people; and all the three books, which are more or less complementary to each other, may be studied with advantage. Any visitor to the Park or frequenter of the hunting-field must be satisfied that there is ample room for improvement even among those who may fairly be considered the flower of English equestrians. It is clear that the education of the *manège* must either have been altogether neglected or conducted upon principles that are radically vicious. Ungraceful seats are only too common; heavy hands are the rule rather than the exception; many riders visibly trust themselves to the training and steadiness of well-broken horses, and would be all abroad did their horses show an excess of light-heartedness or indulge in any ugly tricks of temper. And we are persuaded that many people who can ride tolerably well are grossly ignorant of

horseflesh and of stable matters generally. They have always been in the habit of leaving everything to their grooms; they know nothing of the philosophy of shoeing, biting, or even saddling; and, having learned to mount and sit fast in the saddle, are content to trust everything else to Providence. To riders who have never exercised their brains the study of scientific riding literature is much to be recommended. Doubtless there are many things that can only be taught by practice, or which are only likely to be seriously laid to heart when explained by *visd voce* instruction. But, on the other hand, a readable book on horsemanship may be usefully suggestive in many ways, when it has given the spur to the dormant intelligence; and some of its most useful directions, though they seem to be truisms or self-evident, may nevertheless come as revelations to the ignorant novice. On one point these volumes are harmoniously discouraging—namely, that there are confirmed habits fatal to fine riding, of which it is next to impossible to break oneself. Both Mrs. Power O'Donoghue and Captain Hayes are agreed that it is by no means necessary to learn the art when very young. Indeed, it is Mrs. O'Donoghue's opinion that girls had better not be taught to ride till in their sixteenth year. Before that age, their frames, she thinks, are too feeble; they are apt to acquire an ungainly seat, and may even do permanent injury to the spine. Captain Hayes asserts that some of the straightest gentlemen riders he has ever known never crossed a horse till they were twenty-three or twenty-four, though possibly their seats were scarcely so assured as if they had been accustomed to the saddle from boyhood. But if, for example, the rider is once habituated to steady himself by his unfortunate horse's mouth, the odds are greatly against his ever being cured, although his eyes may be opened to the folly of the practice. Instinct will still be quicker than reflection; and at each movement that threatens to shake his equilibrium, he catches nervously at the support he has become used to. The secret of a secure and graceful seat, and of the light hands as well, which are indispensable to fine horsemanship, is riding from balance. And every beginner would do well to lay to heart Captain Hayes's recommendation to practise without stirrups. Once independent of those useful aids to equitation, the confidence when you feel them under the feet is sublime; and, moreover, it makes you independently indifferent to the accidents to leathers and buckles which might otherwise spoil many a "good thing" in the hunting-field.

Both Mrs. Power O'Donoghue and Captain Hayes are recognized authorities, whose knowledge of their subjects is beyond question, and whose opinions may be accepted with reasoning confidence. On some minor matters they differ, such for example as the best methods with a rearing horse; but on the whole they are very closely in agreement, and Captain Hayes repeatedly quotes the lady with approval. Mrs. O'Donoghue's book is addressed to ladies and will be found the lighter reading for both sexes. She enlivens it with anecdotes and her personal adventures; and introduces besides those personal and feminine touches which give us the sense of her individuality pervading her pages. We have one of these, and a rather amusing one, in the beginning of the first chapter. She pays a tribute to the Empress of Austria, which we do not doubt is very well deserved, as "not only a perfect woman, but an angel of light and goodness." If all ladies rode like the Empress and Mrs. O'Donoghue, there could be little objection to their riding to hounds. But for ourselves, we hold the ungallant opinion that ladies, as a rule, are out of place in the hunting-field, and that their presence is a somewhat selfish encroachment on the pleasures of the rougher sex. "Nimrod," in the famous run in the *Quarterly*, tells how the flyers declined to trouble themselves about the fallen, because "the pace was too good to inquire." But, if a lady goes down, she must be picked up, should the excitement of the chase be at fever-heat; and, even should she be landed in less serious embarrassments, she looks for the attentions a man is constrained to render. Now we take it that, short of an actual catastrophe, the simple and selfish motto of the hunt should be, "every one for himself and Providence for us all." Nor do we consider that questions of precedence ought to crop up in the hunting-field, as in the drawing-room or any ground that is common to the sexes. Mrs. Power O'Donoghue quotes with approval the chivalry of the huntsmen who had been won over by her diplomatic civilities. "Many a time, when I have been holding a good place in a run, we have come across some dangerous fence which it would be death to ride in a crowd, and the huntsman's shout of 'Let the lady first!' has secured her a safe jump, and a maintenance of my foremost position." The lady being where she was, the courteous huntsmen were right. But we are misogynists enough to sympathize with those who are checked in such circumstances. If all ladies went like Mrs. O'Donoghue, the office of pilot might be a pleasure and almost a sinecure. But her recommendation to novices to provide themselves suitably with those masculine guides and guardian angels seems to speak volumes for the good nature of gentlemen. As she reminds them, they will probably get into scrapes, and in any case will need careful looking after. But if young ladies will go out hunting and get off the roads, it is to be hoped they may benefit by Mrs. O'Donoghue's counsels. It is impossible to do more than refer to her instructions, which are exhaustive and embrace everything, from the young girl's introduction to her first pony to the treatment of the fagged hunter in the stable when he has come home from a hard run. The chapter on dress is, of course, especially valuable; it is written with the authority that comes of

* *Ladies on Horseback*. By Mrs. Power O'Donoghue. Allen & Co. 1881.

Riding on the Flat and Across Country. By Captain M. H. Hayes. Thacker & Co. 1881.

How to Ride and School a Horse. By Edward L. Anderson. Allen & Co. 1881.

varied experience, and shows excellent taste and some humour as well. Captain Hayes pays it the compliment of borrowing from it. And few things in her volume have pleased us more than the way in which she advocates kindness to horses. She makes friends of her own animals, and has her reward in their gratitude and affection. She tells us that her favourite hunter follows her like a dog, and has carried her through three successive seasons "without one single display of sulk or bad temper." Yet nobody else can do anything with him, and "he simply refuses to be ridden."

The books by the gentlemen are more exclusively technical, and intended chiefly for men. Captain Hayes handles his subjects methodically like Mr. Anderson, but he goes into more minute detail and is far more comprehensive. His lucid directions for handling the reins, &c., are accompanied by clever little illustrations, which make them still more easily intelligible. He imagines cases of horses with various tricks and vices, indicating the most approved manners of dealing with these. He and Mr. Anderson are at one as to the qualities which are indispensable to making a first-rate horseman, who ought to have nerve, patience, and firmness, with good temper beyond all. Servants are inclined to be rough, and easily fly into a passion; in their ignorance they treat high spirits or timidity as faults, and accordingly many good animals are irretrievably spoiled. Mr. Anderson gives a useful suggestion as to a nervous horse, with a habit of shying, when he advises the rider to seem to pay as little attention as possible. When the rider excites himself, the horse is confirmed in the idea that there is really danger in the object that alarms him. And in the matter of stumbling Captain Hayes goes into its theory, drawing distinctions that may be very serviceable. He explains that there are two kinds of stumbling. One is really dangerous, when the horse is either weak in the forelegs, or cramped in the action, or with the physical defect of too straight shoulders. But when stumbling arises from the knee being insufficiently bent or the toe unduly depressed, thereby catching upon any inequality in the ground, it may be safely disregarded, unless the animal is intended for show rather than use. We may add, for ourselves, that we have ridden excellent horses with this failing; that, frequently as they might trip or stumble, experience told us that they were absolutely sure-footed; but that what we chiefly objected to was that, in cases when they were nervous, each trip led almost invariably to a succession of others. That such stumbling comes of a slovenly manner of going there can be no doubt. It happens comparatively seldom in exhilarating weather or when the horse has been brought fresh out of the stable; but when listless and languid, or when fatigue begins to tell, then you are quickly made aware of his condition by his blundering. Captain Hayes's chapters on flat-racing, steeple-chasing, and training will be read with interest even by amateurs. He backs up his own opinions and experiences on those subjects by communications from well-known trainers and jockeys. As to giving "orders" in a race, his ideas seem to us very sensible. With a young hand instruction may be necessary; but if the jockey be a fairly good one, the riding should be left to his discretion. It is impossible to foresee all possible circumstances, and decisions must be taken on the spur of the moment. As for starting, he calls attention to the necessity for "getting off" as quickly as possible—a matter in which, though it is obviously of paramount importance, some people would appear to be strangely indifferent. As he says, "whatever distance is lost at the start must be made up when the horses are galloping, at which time the effort to regain the lost lengths may very possibly be equivalent to throwing away an advantage of as many pounds." Necessarily we have only skimmed these books, nor was it possible to do more within the limits of an article. But we hope that even our somewhat desultory observations may be sufficient to direct attention to their merits.

VISITED ON THE CHILDREN.*

IN this book an interesting story is made out of painful and unpromising materials. The title, indeed, does not lead one to expect an enlivening narrative. Nor is the tale relieved, as a melancholy tale often is, by much wit or humour in the telling. The dialogue however, though not witty, is sufficiently pointed; and the writer has the good judgment to let the characters show themselves in their speech and conduct, and not to show them by means of long dissertations about them. The plot is good enough to keep the reader's curiosity alive till the end of the third volume, and the writing is, on the whole, very fairly good. We find now and then faulty English, as in the phrase "he might be relied on to do that much"; and faulty French, such as *on revient toujours à ses premières amours*; but it is only fair to say that these sins are not frequent, and that the style is, on the whole, accurate and readable. It is only when the writer attempts the high tragic strain that it becomes absurd or meaningless, and happily the general tenor of the writing is modest and unpretentious. The story opens with a prologue, which serves, not to explain the succeeding incidents—for the full explanation does not come till the end of the book—but to arouse the reader's curiosity about them. We are shown a death-bed scene in a little cottage in St. John's Wood, where a young girl lives under the charge of a certain Dr. Hamilton, a rising light of the medical profession. The girl has been brought there by him, and is supported and tended in

her illness by him. She dies, and her death and the doctor's grief at it are witnessed by the young wife of the latter, who has received information of her husband's visits to the girl, and contrives to steal in unobserved upon the scene. The natural inference which she draws turns out at the end of the story not to be the true one; but, nevertheless, the facts prove to be not such as are likely to promote domestic happiness; and between the doctor and his wife there is thenceforward an estrangement. She quits the scene, as the author says in the tragico-mysterious style to which we have referred, "wearing that same white mask pressed down upon her face as though death itself had branded it there, the sign manual of some unhallowed act never to be taken away or obliterated on this side the grave; and—we shall meet her again years after—it never is."

Years after a certain Mrs. Dysart, with her two daughters, Sybil and Jenny, appear in a village to the south of London, where they take a cottage and live in the strictest seclusion. Their means are slender; and the mother, though understood to be well connected and able to command any society in the neighbourhood, does all she can, first to avoid it altogether, and afterwards, when this proves impracticable, to limit as far as possible her relations with it. This line of conduct is resented by some of the newly enriched families of the neighbourhood, the ladies of which—as the author says with a not uncommon confusion of a famous battle-field with a famous milliner—get their dresses from Würth. It is not till Sybil has reached the age of twenty and Jenny of eighteen that the Dysarts have much contact with the outer world. By this time the girls, both pretty and attractive, can no longer, in the nature of things, be kept in seclusion; and a ball at a Lady Ashleigh's, sister-in-law to the Rector's wife, and one of the few acquaintances whom Mrs. Dysart has consented to make, brings Sybil forth into the society of the district. Sybil, the heroine of the story, is interesting, in spite of her want of strength of mind and character, partly by her pathetic fate, and partly by the ardent and unreasoning affection which she bestows on a worthless scamp who afterwards deserts her. She first, however, is engaged, soon after her appearance in society, to Lionel Ashleigh, nephew of Lady Ashleigh, and son of the Rector. He is a curate in the neighbourhood, and behaves from first to last in the most exemplary manner. Possibly it is for this very reason that he fails to fix the affections which he seems at first to have won, and is eclipsed in Sybil's thoughts by Gareth Vane, a man of the worst character, an unscrupulous trifler with the feelings of all fair and accessible ladies, and one against whom wise matrons caution foolish virgins, with the natural result of stimulating the interest and curiosity of the latter.

Gareth Vane, the wicked hero of the tale, is the brother of Mrs. Hamilton. Among the many ladies about whom he hovers is a Mrs. Beverley, a young, handsome, and wealthy widow, much in love with him, but willing to wait her time and too clever to frighten away, by premature attempts to fix him, an admirer who could easily console himself elsewhere. Gareth happens to be visiting in the neighbourhood of the Dysarts, and one evening has a chance meeting with Sybil, whose beauty and *maîtress* charm him and make him eager to know more about her. His ardour increases in the chase, and he ends by being partly in love, partly ambitious to rob Lionel Ashleigh of his promised wife, and partly interested in the game he is playing. Sybil is in no such mixed state of mind. She falls over head and ears in love with Gareth, will believe nothing to his discredit, and after one or two critical interviews with the two admirers, dismisses Lionel on the plea that she did not know her own mind when she accepted him. She naturally has to pay the penalty of this breach of her engagement in the estrangement, not of Lionel, who continues to act a generous and unselfish part by her, but of Lionel's relations, and of her own mother, who declines even to speak to her. Sybil's isolation, her clinging trust in Gareth, and Jenny's fidelity in not forsaking a sister whose blindness she deplores, are prettily described. The more Gareth's worthlessness is proved to her, the more she seems to idolize him. Gareth has impulsively pledged himself to her, but hardly has he done so when he feels the constraint of his new ties, and the competing fascinations of Mrs. Beverley. At the end of the second volume the sort of mystery which has surrounded the Dysart household is dispelled in a confession which Mrs. Dysart makes to Lionel Ashleigh, the jilted lover. It turns out that Mrs. Dysart is the sister-in-law of Amy Dysart, the girl whom we see on her death-bed in the prologue. When she first marries, her husband's sister lives with them, and the husband's affection for his sister arouses the jealousy of the wife. He was at first Consul at Genoa, but his removal to the consular post at Fiume is turned to account by the wife in order to get rid of the young girl. She prevails on him to send his sister to a school at Brighton, and intercepts the letters which Amy writes to him complaining of her new life. The girl at last, receiving no answer to her many letters, imagines herself forsaken, and one day the news reaches the Dysarts at Fiume that she has left the school, leaving no traces behind by which she could be found. The next news, after an interval, that they get of her is the anonymous announcement that she is dead, and her death is followed before long by that of her brother, after which Mrs. Dysart returns with her children to England. In the glow of her penitential confession, Mrs. Dysart consents to forgive Sybil, and goes to her daughter's room to tell her so, only to find her gone away.

Gareth in London has come once more under the charm of Mrs. Beverley, and regrets more and more the choice that he has made.

* *Visited on the Children*. A Novel. By Theo Gift. 3 vols. London: Tinsley Brothers. 1881.

In this mood and resolved to bring matters to a crisis he writes to Sybil, bidding her meet him in the evening in a wood near the railway station on a particular day. There is a mistake as to the day, and Sybil, after waiting vainly for her lover, falls into a pit in her attempts to find her way home. This is the night on which the reconciliation between mother and daughter would otherwise have taken place; and when the daughter returns the next morning, after being helped out of the pit by an ill-conditioned quack doctor of the neighbourhood, she finds that the mother has herself died, and that the reconciliation can never take place. Trouble now accumulates on Sybil. Her mother is dead; Gareth, not meeting her on the wrong day, uses her absence as a pretext to throw her off heartlessly and with insult; and the events of the night in question naturally give something for slanderous tongues in the neighbourhood to take hold of. Sybil herself falls ill, and through her illness still nurses the belief that somehow or other Gareth is not to blame, and will come back to her at last. He, meanwhile, has gone off on a yachting excursion to Norway with Mrs. Beverley and other friends. Lionel Ashleigh, in the meantime, exerts himself to make his own family forgive Sybil, which he succeeds in doing, and to clear her reputation from the slur which her nocturnal adventure had left upon it. His object is to prove an *alibi* for Gareth, now in Norway, on the night in question; and, in order to do so, he has occasion to call on Dr. Hamilton, Gareth's brother-in-law. The visit leads to the result Lionel aims at, and also to a disclosure of Dr. Hamilton's own past history, which is connected with that of the Dysarts. In his younger days, when a doctor beginning practice at Brighton, he had casually met Amy Dysart, then at school, and in a forlorn state of mind at leaving her brother; and the two fall in love with one another, or rather, perhaps, she falls in love with him. Dr. Hamilton had been a popular visitor at the house of the Vanes, and rumour had coupled his name with that of Miss Vane, whom he liked and esteemed, without loving her. Feeling partly bound in honour by these reports, and partly led on by the advantage which it is to a doctor to have a wife, especially a rich wife, he engages himself to her; and at this critical time Amy Dysart, finding her life at the Brighton school unbearable, flies to him for protection. Without breaking with either, he secretly has Amy taken to London, and marries Miss Vane. Too honourable to wrong Amy, and too cowardly to tell the story frankly to his wife, he continues to take charge of the girl, and to tend her through the fatal illness into which she gradually falls. It is only at Amy's death-bed that the wife knows for certain that her husband loves another woman, and then the time for any acceptable explanation is past. Mrs. Hamilton interrupts the interview between her husband and Lionel, and notwithstanding years of estrangement is led at last to believe that her husband, whatever other blame might attach to him, had nevertheless, in perplexing circumstances, been faithful to her. The book closes with the death of Sybil, with the marriage of Gareth Vane in Norway with Mrs. Beverley, and with the betrothal of Lionel to Jenny.

The main fault of the book lies in the monotonous melancholy which pervades it. The women are more lifelike than the men, and the conversations of the latter when they are alone together are suggestive of the sex of the writer. It appears that "Egad" is a favourite oath with Englishmen of the present day. Why not "Zounds" or "Zooks"? There is, in spite of its faults, much in the story that is graceful and pretty.

AMERICAN LITERATURE.

IT is somewhat late, sixteen years after its apparent termination, to publish a history of General Grant's military career (1). A hostile critic might suggest that the lapse of time has contributed not a little to General Badeau's breadth of assertion and license of comment. What is not so easily explained is why the subject of the memoir should have permitted its publication. Perhaps, were General Grant formally to repudiate a particular history dedicated to his own renown, it might be held that silence gave his sanction to another. But General Badeau's relations with his chief are sufficiently notorious as, in the field, at the White House, and subsequently perhaps the most intimate of his personal *entourage*; and such a work will hardly be regarded as uninspired and independent. It will be universally assumed to contain nothing that in its author's estimation would seriously displease his patron; and, while such an assumption might easily be carried too far, the mere fact that General Badeau should be permitted to put himself forward as in some sense the authorized military biographer of his chief is, to say the least of it, unfortunate, the more so because there is no chapter in this work that will not give great and just offence to men the equals in social and almost the equals in military position of General Grant himself. Moreover, General Badeau grossly depreciates both the Confederate leaders and the Confederate troops, and where we have been able to test his statements we have found them untrustworthy. We venture to say that the author himself would hardly have dared ten years ago to publish what he has now said of General Lee. The qualities denied to Lee by his present assailant were precisely those in which by the universal testimony of friend

and foe he most signally excelled; that the faults imputed to him are precisely those most conspicuously absent from his character. If on several occasions General Lee failed to follow up by an effective offence a splendid defensive victory, so did every Southern leader without exception. And the reason is obvious. General Badeau studiously ignores or falsifies the comparative numbers of the armies; but in nearly every great battle the Federals actually on the field outnumbered their opponents by three to two. They could always within a few days have outnumbered them by three to one. At Chancellorsville 130,000 men were routed, crushed into utter helplessness and dismay, by 50,000. This, by the way, affords a crushing refutation of General Badeau's assertion that the Confederates would not fight except behind entrenchments. Victories gained at odds like these are almost necessarily fruitless. Honour enough has been conceded to General Grant. A panegyric like this provokes the most patient critic to remind his admirers that when he first attacked Lee, it was with threefold numbers; that he was beaten in half a dozen pitched battles—in truth, in almost every pitched battle he fought on Virginian soil; and that his victory was gained at last solely by force of overwhelming numbers, enabling him to surround and cut off alike from reinforcement and from supplies an army which, when it entered the lines of Richmond, numbered 45,000 all told against 150,000 actually mustered on the same ground; that the six days' retreat was the retreat of 28,000 sabres and bayonets in face of a pursuing army of more than 120,000. A thoughtless reader might suppose from this work that General Grant was the only really able commander on the Northern side, and that his successes were achieved against an enemy as strong in numbers and resources as himself.

Mr. Lodge confesses in his preface (2) many, we might say most, of the faults of a book which, notwithstanding these, is likely, we think, to become a standard work of reference for those who wish to obtain within moderate compass a tolerably accurate idea of the fortunes and development of the English colonies in America prior to the War of Independence. It has over many of its competitors the advantage of giving due importance to the Southern plantations. The historians of the colonial period have been, for the most part, New Englanders or men of Puritan sympathies, and have written, if not intentionally, yet from natural bias and party prejudice, in a manner which has led their readers utterly to misconceive the comparative importance of the different colonies. Mr. Lodge gives out of 476 pages 211 to the six colonies south of Mason and Dixon's line; and, on the whole, treats the various political and historical issues involved in his subject with as much moderation, if not impartiality, as can well be expected from an American historian of a period whereof there are but few English histories, and few of those that do justice to the position and purposes of the mother country. Statistics, descriptions more accurate than lively, and a mass of information rather valuable than entertaining concerning the industrial progress of each separate colony, load the work with a quantity of somewhat heavy reading, and will, we fear, somewhat interfere with its general popularity. But, within such moderate compass, there is perhaps no work that gives a more correct view of the actual career, the general and comparative importance of each American settlement while they remained ours. Perhaps the most interesting individual feature of the work is the map showing the condition of the several States at the moment of the Declaration of Independence. How different was the America of a hundred years ago from the present is visible at a glance. That part of Massachusetts which has since been formed into the State of Maine may not show truthfully the real boundary of the country; but this is of the less importance because at that period the disputable territory was almost utterly uninhabited. The whole region, equal in extent to all the rest of New England, contained four towns of sufficient importance to be marked upon this map, and all of them on the sea-coast. The same may be said of New Hampshire. Massachusetts, Rhode Island, and Connecticut were settled, if somewhat sparsely, throughout their limited extent, while New York practically consisted of two or three strips of country, the most important of which was the Valley of the Hudson and Lake Champlain, with the country between these and the Connecticut River; the next in value the much more thinly-settled region along the St. Lawrence and Lake Ontario. New Jersey, with that part of Pennsylvania which lies east of the Susquehanna, Maryland, and Delaware, were the whole inhabited part of what has been since known as the Middle States; while Virginia, claiming a vast territory north of the Ohio, practically consisted almost exclusively of a part of what is now called the coast or seaboard country, the eastern part of the region whereof the Blue Ridge forms the western boundary. That State, then the most important of all, as well as North Carolina, South Carolina, and Georgia, nominally extended west to the Mississippi; but practically the country west of the 82nd parallel was inhabited only by roving tribes of Indians. Florida was Spanish, and the whole country west of the Mississippi under the name of Louisiana was nominally a French possession. Unless these facts are constantly borne in mind, the whole history of the war of independence must be totally misunderstood. It was not what we call the United States, not even the thirteen colonies as delineated on the map, that England undertook to conquer, but simply a strip of land along the sea coast for the most part accessible to attack from a

(1) *Military History of Ulysses S. Grant, from April 1861 to April 1865.* By Adam Badeau, Brev. Brig.-Gen. U.S.A. Vols. II. and III. New York: Appleton & Co. London: Trübner & Co. 1881.

(2) *A Short History of the English Colonies in America.* By Henry Cabot Lodge. New York: Harper & Brothers. 1881.

Power commanding the sea, of which the widest portion was probably that between Boston and Albany; a country which, though still the most densely peopled portion of the United States, and containing the greater part of their manufacturing industry, and necessarily including the principal outlets of their foreign commerce, might be submerged to-morrow without materially reducing the greatness or impairing the power of the Union.

Mr. Boyd's elaborate treatise on the resources of South-West Virginia (3) is but an especially complete, and perhaps a somewhat exaggerated, specimen of a class of literature whereof we have for some years past endured something like a surfeit—the glorification, not so much from local vanity as for practical objects, of the material advantages offered, whether to emigrants or to capitalists, by each several State of the Union. Of the older States along the Atlantic seaboard, it is true probably that none boasts greater natural wealth than that which till the late war still claimed, and on the whole, though with many verbal denials and in spite of many rival pretensions, was acknowledged to be the foremost State in the Union. Historically she has no rival but Massachusetts. As a home she presents to English settlers such attractions as certainly no other part of America can proffer. The Virginian people seem to have inherited all the best characteristics of their English ancestry, while their aristocratic pretensions, well or ill founded, have done much to maintain among them a high tone of honour, a courtesy at once scrupulous and frank, a cordiality of demeanour, and a general refinement which are very striking. Virginia has undoubtedly great mineral wealth as well as agricultural resources still undeveloped, and but superficially exhausted here and there by the reckless culture characteristic, not so much of slavery as of a state of things in which labour was especially costly and land especially cheap. But it is only in the beauty of her scenery and the character of her society that she can pretend to rival or surpass the States that have come into being since she began to decline from the culminating point of her fortunes. Her plantations are less promising than those of the South-West, her pastures less abundant than those of the prairie lands she surrendered on the formation of the Union; her mining possibilities far less developed than those of Pennsylvania. At the same time, it must be remembered that Virginia is not, like her sisters further South, by nature and obvious destiny a semi-negro State. There is no part of her territory wherein Englishmen, Scotchmen, and Irishmen could not cultivate the soil and preserve their health as perfectly as at home. Slavery was to her a resource, but never a necessity. Slavery alone retained a large negro population upon her soil; and there can be little doubt that in another generation the bulk of her labouring population will be as exclusively European as that of Massachusetts or Illinois. We hear, moreover, of discoveries of knolin and other invaluable materials in the immediate vicinity of Richmond, which have encouraged capitalists to found a china manufactory there, and which, should they realize their present promise, may create a new and valuable industry. Nor can we see why the valley of the Shenandoah should not one day rival that of the Rhine in the growth of wines for half the world. Its winter is not more severe, its summer even more genial. But the difficulty, the disadvantage of Virginia, the practical answer to works which, like the one before us, set forth in detail her varied and vast resources, is to be found in the similar promises, equally true, and yet more amazing, issued by nearly every one of her sisters to the West and South.

The collection of the *Anniversary Memoirs of the Boston Society of Natural History* (4) celebrates the jubilee of that body. It contains not a few papers of considerable local and scientific interest, and is illustrated by portraits of the President and principal members of the Society.

A much more interesting work, a valuable monograph, though but in pamphlet form, is Colonel Mallory's treatise on the sign language of the North American Indians (5), published by the Smithsonian Institution. It has been a favourite theory of many American ethnologists that the tribes speaking a variety of mutually unintelligible languages or dialects had a common and universal gesture language, by which Hurons and Sioux, Delawares and Mandans, might understand one another with absolute certainty. This idea has been confirmed by the constant use of significant gestures by Indian orators at the council fire, gestures which it seems have more than once enabled a stranger to the language, but familiar with the gesticulation of other tribes, to make out at least the outline of the address. This is not Colonel Mallory's view. He gives in detail the different gestures and technical signs employed by various tribes, and shows that those in use among remote peoples are often entirely distinct. All are, of course, more or less arbitrary, though the significance of many is easily understood even from the description, and would probably be more intelligible still to the eye. Colonel

Mallory believes that the extent to which the gesture language is employed as an actual means of conveying, and not merely of enforcing, ideas is greatly exaggerated. In his belief, a full knowledge and facility in the use of these signs is possessed only by a minority; but, these being specially employed as interpreters and guides, and being, moreover, often leading orators and politicians, their knowledge has made a greater impression on white observers than the ignorance of the silent majority with whom they were less familiarly acquainted. The author's theory rests the extension and universality of gestures among the Indian tribes on the limited number of each particular race, and the frequent contact between tribes whose language was mutually unintelligible. He ascribes to the same circumstances, and not to their more passionate temperament, the frequent use of gesticulation among the races of Southern Europe, especially in oratorical or other excitement; and gives as an instance an alleged address by King Ferdinand of Naples to a crowd, which, making too much noise to hear an articulate word, yet understood distinctly the gesture language of their sovereign.

Mr. Henry George publishes a pamphlet on the Irish land question (6) which has the merit of being a little more extravagant, of going a little further in the direction of universal revolution and Communistic immorality, than the recommendations of the Land League itself. Mr. Bourinot's little book on the intellectual development of the Canadian people (7) contains a good deal of interesting information respecting the progress of education, journalism, &c., in the Dominion, somewhat incoherently put together. Mr. Barnard's treatise on Co-operation (8) contains a collection of familiar and comparatively unknown facts regarding the present extent to which the system, first fully and successfully developed by the Equitable Pioneers of Rochdale, has spread and taken root in Europe and America. The different chapters relate the story, and set forth the accounts of a number of Societies that have already achieved a considerable position; but, familiar as it is, the most interesting chapter in the history of Co-operation is still the first. Few stories of human progress are comparable in the significance they possess for the present generation to that of the twenty or thirty working-men who started the little store in Toad Lane some forty years ago; whose capital, then amounting—if we remember aright—to some ten or fourteen pounds, now reaches nearly two hundred thousand; whose tiny shop, with its sack of flour and small selection of groceries, is now represented by innumerable branch stores, by more than a dozen libraries and reading-rooms, and by factories and wholesale warehouses.

The most interesting part of the Report of the Corporation of the Chamber of Commerce of the State of New York for the year 1880-81 (9) is that which deals with the bankruptcy laws of the United States, or, rather, with the absence of anything deserving of that name. The Chamber unanimously recommend that in any future attempt to establish an effective Federal law on the subject America shall adopt the principle of English bankruptcy statutes, by which the Courts are entitled, under certain circumstances indicating the culpability or recklessness of the bankrupt, to withhold his certificate, and even to render his after earnings for a prolonged period liable to the claims of his creditors. Dr. Kane's *Drugs that Enslave* (10) deals with an evil familiar enough, and we fear greatly on the increase. Miss Goodale's *Journal of a Farmer's Daughter* (11) describes the varied graces and beauties of the seasons in New England. Miss Green's *Sword of Damocles* (12) and the anonymous *Nameless Nobleman* (13) are novels of an average quality; and the same qualified commendation may perhaps be allowed to Mr. Stuart Sterne's poems (14).

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,389, JUNE 25, 1881

The Land Bill. The Transvaal. Mr. Bright's Programme.
Tunis. Free-Trade. The Channel Tunnel. Opium in Burmah.
Description. The Telegraph Clerks.

Father Curot's New Book.

A Congress of Domestic Economists. "The Electric Storage of Energy."
The Lincoln Architectural Society at Stamford. Siberia to Switzerland.
Franco-American Grapes. The Trade between France and England.
Architecture in 1881. The Opera. June Racing.

Wheeler's History of India. English Gardens.
Mrs. Geoffrey. "Twist Greek and Turk." The Occult World.
Art and Archaeology at Oxford. Some Classical Texts and Notes.
Books on Hiding. Visited on the Children. American Literature.

CONTENTS OF No. 1,388, JUNE 18, 1881:

The Land Bill—Eastern Affairs—The Tenure of Land—The Senate and M. Gambetta—Local Option—America—Surrey Commons—The Dissolution of the German Parliament—Vaccination and Small-Pox.

Dulwich College—Skirmishing at Liverpool—Destruction of the City Churches—The Curiosities of Criticism—The Metropolitan Police Force—The Bank of France—Sculpture in 1881—The Opera—The Theatres.

The Correspondence of Talleyrand—Australian Aborigines—Two Pretty Girls—New Colorado—Oldfield's Nipai—Gomme's Primitive Folk-Moots—Memoirs of the Duke of Saldanha—Two Novels—German Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

DORÉ'S GREAT WORKS, "CHRIST LEAVING the PRETORIUM," "CHRIST ENTERING JERUSALEM," and "MOSES BEFORE PHARAOH," each 33 by 25 feet, with "Dream of Pilate's Wife," "Christian Martyrs," &c. at the DORÉ GALLERY, 35 New Bond Street. Daily, Ten to Six. Is.

THE GROSVENOR GALLERY.

SUMMER EXHIBITION.

Now Open daily, Nine to Seven.

Admission, One Shilling. Sea-on Tickets, Five Shillings.

AIVASOVSKY EXHIBITION.—"COLUMBUS'S SHIP IN A STORM," "COLUMBUS LANDING ON SAN SALVADOR," and many other interesting works by AIVASOVSKY, the greatest of Russian Artists. Now on View at the FALL MALL GALLERY, 48 Pall Mall. Admission, 1s. from Ten until 8 A.M.

SOUTH KENSINGTON MUSEUM.—The SPECIAL LOAN EXHIBITION OF SPANISH and PORTUGUESE ART is NOW OPEN—Mondays, Tuesdays, and Saturdays, from 10 A.M. to 10 P.M. free; and on Wednesdays, Thursdays, and Fridays, from 10 A.M. to 6 P.M. on payment of Sixpence.—By Order.

THE VICTORIA UNIVERSITY, MANCHESTER.—The STATUTES and REGULATIONS regarding DEGREES, EXAMINATIONS, and COURSES of STUDY are now published. Students, and others desirous of information, may obtain copies, on application to the Registrar.

R. ADAMSON, Registrar.

OWENS COLLEGE, MANCHESTER.—Under a recent Resolution the Council propose to appoint to FIVE FELLOWSHIPS in SCIENCE or LITERATURE, each of the value of £100, tenable for one year, but renewable for two years further.

The Appointment will be made not on the results of Examination, but after consideration of documentary or other evidence. Every holder of a Fellowship will be expected to devote his time to the prosecution of some special study approved by the Council. Further particulars may be obtained on application to the PRINCIPAL.

SOMERSETSHIRE COLLEGE, BATH.—An EXAMINATION will be held on July 13 and 14, to elect to SEVEN ENTRANCE SCHOLARSHIPS.—Particulars may be obtained from the HEAD-MASTER.

HIGHGATE SCHOOL.—Sir R. CHOLMELEY'S FOUNDATION, 1868.—SIX SCHOLARSHIPS, £21 per annum, open to Competition in July. Further particulars on application to the Rev. the HEAD-MASTER, School House, Highgate, N.

PREPARATORY EDUCATION.—TWO SCHOLARSHIPS of 20 Guineas per annum, in a First-class SCHOOL, on the South Coast, will be given in July to BOYS under Eleven, who are intended for one of the Public Schools. Preference will be given to the Sons of Clergymen, and easy Examination Papers will be sent to the homes of applicants.—Address, CLAUDE, care of Messrs. Askin, Gabbins, and Kilik, 92 Backville Street, London, W.

MALVERN COLLEGE.—The NEXT TERM commences Tuesday, September 27. For particulars, apply to HENRY ALDRICH, Esq., Secretary.

TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.—The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and all competitive Examinations. Exhibition to the Universities of £50 per annum Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. (Terms 6 and 40 Guineas.—Apply to the WARDEN.

ST. EDMUND'S COLLEGE, SALISBURY.—A HIGH-CLASS SCHOOL for BOYS of GENTLEMEN. The religious training is upon definite Church principles. Boys are Educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, £75 a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOUNDS, D.C.L.

UNIVERSITIES, ARMY, PUBLIC SCHOOLS.—A Derbyshire CLERGYMAN, M.A. Oxon, formerly Assistant Classical Master to the Charterhouse, and for several years a Past Tutor in Oxford, receives a few PUPILS for the above examinations. Terms, for boys over sixteen, £150; under sixteen, £120.—Address, M.A., the Rectory, Marston Montgomery, Derby.

CLASSICS.—An OXFORD FIRST CLASSMAN, fifteen years' experience, receives PUPILS.—Address, B., 33 Blenheim Crescent, Notting Hill Station.

PREPARATORY SCHOOL, AMESBURY HOUSE, Page Heath, BICKLEY, Kent.—Rev. EDMUND FOWLE receives THIRTY-THREE BOYS under the age of fifteen, to prepare for the Public Schools.

The house, surrounded by six acres of land, is situated in a charming locality, thirteen miles from London.

There is every requirement for a high-class Private School, a cricket and football ground, large iron playroom, fencing gymnasium, &c., two Eton five-courts, workshop, dry playground, and a run of a third of a mile on a dry gravel path.

The soil is gravel, and all the Sanitary arrangements in and out of the house have been under the special supervision of Dr. ALFRED CARPENTER, of Croydon.

Every Educational advantage given and many comforts offered, the greatest care being taken of Little Boys on their first leaving home.

Great success has been met with, several open Scholarships gained, and in no single case has a Boy failed to take his proper place at a public school.

Rev EDMUND FOWLE is well known by his very successful series of Latin and School Books, and for his Eton Greek Readers, written by special request for that School, and now in use at Eton, Harrow, Merchant Taylors', &c. Terms, from 20 to 120 guineas.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

CRYSTAL PALACE SCHOOL of PRACTICAL ENGINEERING.—A young Married CLERGYMAN, residing within easy walking distance of the Crystal Palace, receives Two or Three STUDENTS whose Parents desire advantages of a cheerful and well-ordered Home. Two Vacancies for September. Highest references.—Address, in first instance, Rev. M.A., Farmer's Library, Upper Norwood, S.E.

EDUCATION.—GERMANY, BONN—on-the-Rhine, 37 Baum-schuler Allee.—The Fraulein KUNDE receives a limited number of YOUNG LADIES. Home comforts, best masters, unexceptionable references.—For particulars apply to the above.

SECRETARYSHIP, or other Employment, REQUIRED by a GRADUATE of CAMBRIDGE and BARRISTER-AT-LAW. Would not object to travel.—Address, A. Z., 18 Portland Road, Notting Hill, London, W.

A GENTLEMAN desires OCCUPATION anywhere with modern and noble-thinking men who aim at promotion of human progress as much as at money. Aged Forty. Slightly nervous (hyperaesthetic vasomotor). Has been physician & has given up; cannot work hard; cannot bear heavy sky. Understands languages, but not music; no calligraphy; no drawing.—Address, Neco Orum, Steel & Jones, Advertising Office, Spring Gardens, S.W.

CONSOLS versus GROUND RENTS.—Consols pay barely 3 per Cent. Freehold Ground Rents, equally safe, pay 4 to 4½, and constantly increase in value. Descriptive Paper gratis. Sixty Lots for Sale.—Messrs. BAKER, 55 London Wall.

HOUSE WANTED, to RENT or PURCHASE, containing not less than four Bedrooms, with three or four Reception-rooms, Bath-room, with Hot and Cold Water Service, and the usual Domestic Offices. West or North-West situation preferred, on the Omnibus route to Charing Cross. Rental value from £70 to £80 per year. Address, A. B., 38 Southampton Street, Strand, W.C.

WIMBLEDON PARK ESTATE.—FREEHOLD BUILDING LAND for SALE, in large or small Plots, according to situation. Free Conveyances. Roads and Sewers made. 720 acres remaining to select from.—Apply to the Resident Agent, Mr. ALFRED W. OBOCKE, Surveyor, Wimbledon Park.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel. HENRY HULL, Manager.

PENINSULAR and ORIENTAL STEAM NAVIGATION COMPANY.

UNDER CONTRACT FOR HER MAJESTY'S MAILS TO INDIA, CHINA, AUSTRALIA, &c.

REDUCED RATES OF PASSAGE MONEY.—SPECIAL RETURN TICKETS.

Weekly departure for Bombay.

THE BOERS AND THE GOVERNMENT.

MR. GLADSTONE'S answer to an address from a body of loyal English and Dutch inhabitants of the Transvaal exhibits his habitual faculty of imagining facts which may happen to support his opinions or his policy. The ease with which he deceives himself diminishes the confidence which would otherwise be placed in his arguments and in the statements on which they are founded. It may be assumed that Mr. GLADSTONE really supposes the rebellion in the Transvaal to have been connected with the rejection by the Cape Parliament of the scheme of Federation. Less fanciful reasoners will remember that the Boers never desired Federation, and that they had no motive for taking an interest in the party squabbles at the Cape. The decisive vote of the Assembly was given some months before the outbreak of the insurrection, and it was never urged as a grievance or an excuse. Still more characteristic is Mr. GLADSTONE'S suggestion that the restoration of the independence of the Transvaal only fulfils the promise that the inhabitants should be allowed to manage their own local affairs. Shortly before the beginning of hostilities he had formally declared that the QUEEN could not be advised to relinquish her sovereignty. After three defeats of English troops, he suddenly invented the relation of suzerainty, with the avowed purpose of claiming some indefinite dignity of which it can only be said that it is less than sovereignty. An Englishman who may have invested money in trade or in land with the assurance that the QUEEN should still be his sovereign, is greatly wronged by being not only made a citizen of an alien Republic, but by probably being subjected to permanent disabilities, if not to the loss of his property. As long as the Transvaal continued to be English territory, the Dutch would not have been allowed to disfranchise or to maltreat colonists of English descent. The Government has never explained what it was fighting for down to the time of the capitulation. According to Mr. GLADSTONE, its object seems to have had something to do with the abortive project of Confederation, and also to establish a form of government which, as he strangely asserts, is indistinguishable from complete independence. Settlers in South Africa are probably more puzzled than observant English politicians by Mr. GLADSTONE'S peculiar mode of reasoning. His intellectual constitution has produced an inveterate habit of first building up practical conclusions, and then, as it were, underpinning them by materials independently collected. His apologetic explanations are generally remote from his original motives. When he determined on a policy of surrender his action was probably explained by a morbid horror of resort to force. The theory that independence is the same thing with the control of local affairs is almost certainly an afterthought. It may be hoped that there is no foundation for the rumour of the transfer of Mr. COURTNEY to the Colonial Office. Although his abilities entitled him to office, his appointment to the Colonial Office would at this moment be in the highest degree offensive and improper.

If the negotiations result in a peaceable settlement, it will no longer be useful to recur to the patched-up peace of trace which was to be settled both in principle and in detail by the Commission. In the meantime it is proper to remark on the impediments to a just compromise which were created by the hasty decision of the Government. The possibility that the Boer leaders might agree to conditions

which would not be performed by their constituents was left out of the calculation. The restoration of the guns taken at Potchefstroom and the punishment of the perpetrators of two or three murders were promised by the representatives of the insurgents, but neither undertaking has been fulfilled. It seems that Sir EVELYN WOOD vainly insists on material proof both of the good faith of the Boer delegates and of their representative character. The restoration of the guns may perhaps be a mere form, but it would serve as a pledge of adherence to more important stipulations. The reservation to the English Government of a portion of the territory formerly claimed by the Transvaal is more unpalatable to the Boers than the restitution of the guns which had been improperly acquired. According to one account, the negotiators have, with much simplicity, declared that they only agreed to the sacrifice in the belief that it would never be exacted. It has been fairly remarked that the Boers have little opportunity of making their opinions or purposes known. It is possible that they may in some instances have been misunderstood or misrepresented; but the accounts of newspaper Correspondents have been, for the most part, apparently dispassionate and fair. It is also probable that some of the Boer leaders have communicated with their many and zealous friends in England. Nevertheless, they are entitled to the benefit of a doubt whether their conduct has been obstinate or unreasonable. If Sir EVELYN WOOD'S urgent advice had been followed by the Government, a reasonable settlement would have been more easily accomplished.

Whatever may be thought of the past policy of the Government, it would now be a great misfortune that the negotiation should fail. It is desirable to be firm on such points as securing the rights of English residents, and the definite abandonment of any claim to maintain relations with foreign Governments. On the other hand, it is doubtful whether it is for the interest of the paramount power to demand large powers for the Resident. It would naturally be his duty to protect his own countrymen if they were subjected to oppression; but it would be difficult to enforce a protectorate of the natives except by incessant interference with domestic policy. It is possible that the conduct of the Boers may have been unfairly judged. Bishop COLenso, who has always been an advocate of native interests, has come forward to vindicate the character of the Boers, though rather by inference than with a minute knowledge of facts. He argues that a vast body of natives would not have remained in the Transvaal if they had been habitually ill-treated, inasmuch as they might have at once obtained relief, if it was required, by migrating into the neighbouring province of Natal. If the Bishop's reasoning is not conclusive, his opinion is entitled to consideration, though it must be remembered that he has seldom agreed in the political views of the representatives of the English Government in South Africa. The chief objection to the assumption of any kind of protectorate is that it would, if it were actively administered, lead to frequent disputes and collisions. To a certain extent similar difficulties may be expected to arise if the tribes on the eastern frontier of the Transvaal are formally declared to be independent. Their rights must hereafter be vindicated if they are ratified by any convention or understanding; and yet an alliance with Zulus or Swasias

against the Dutch Republic will be in a high degree invidious and embarrassing. The evil effects of the unfortunate Zulu war are felt in the course of the present negotiations, as in every political transaction which has occurred since the peace. It is plausibly contended that the disarmament of the conquered Zulus, and their distribution into petty clans, imposes on the English Government an obligation to defend them against the possible encroachments of the Boers. It will probably be judicious to defer the consideration of their claims until the case arises in practice.

If any section of politicians in England still feels an interest in the welfare of the Boers, they may congratulate their friends on the great and unqualified advantage which they have derived from the annexation and its consequences. They were saved from more than one collision with native enemies which might probably have been disastrous; and the virtual revocation in their favour of the territorial award relieved them from the necessity of making a painful sacrifice. When CETEWAYO, their most formidable enemy, was supposed to resist the apparent injustice, he was punished for his assumed discontent, by the invasion and conquest of his dominions. The Boers have from that time no longer had any Zulu enemy to watch; and soon afterwards the less powerful chief, who had defeated them immediately before the annexation, was reduced by the English forces to submission. Foreign sympathizers, if not the Boers themselves, ought to appreciate the domestic improvements which have been effected in two or three years by a regular and civilized government. The revenue has been largely increased; useful public works have been commenced; and, for the first time since the original settlement of the country, justice has been regularly administered. It is probable that the advance of civilization will be discontinued; but perhaps some traces of an orderly system of government may remain. The Boers are, perhaps, more likely to congratulate themselves on the interest which their cause excited among English philanthropists and Continental busybodies. For the first time the existence of their country was recognized in Holland and in Germany, and they suddenly became the favourites of all the numerous foreigners who entertain for any reason ill-will to England. The Boers have also had the opportunity of inflicting humiliating defeats on English troops, and of forcing or inducing the Government to surrender the claims which had immediately before been asserted in the plainest language. Their involuntary benefactors can scarcely hope for gratitude; but the consciousness of unmixed success ought to qualify the ill-will which may probably be cherished.

THE LAND BILL.

THE facility with which the House of Commons granted to Mr. GLADSTONE the almost unprecedented privileges which he requested on Tuesday seems to have, for the moment, shaken the confidence even of his blindest supporters in the belief which they have hitherto affected as to a factions and malignant obstruction on the part of the Conservative Opposition. Sir STAFFORD NORTHCOTE'S demand for at least a verbal pledge that the Government would not misuse their opportunities was accepted by all parties and almost by all persons as just and reasonable, and it was recognized as such by Mr. GLADSTONE himself, though, as usual, his assurance was couched in terms susceptible of more interpretations than one. One of the Government organs has reproachfully referred to the baseness of doubting the intentions of a Minister so scrupulous as the present PREMIER. The answer is obvious. No one in his senses considers Mr. GLADSTONE unscrupulous; no one in his senses ignores the extraordinary fertility of interpretation and expedient which enables him to explain his own words exactly as it may be most convenient to him. Every one, for instance, after the compromises which were brought about by Mr. HENRIAGE'S amendment, supposed that the Irish landlord was to have a right of access in the first instance to the Court. Mr. GLADSTONE'S recognition of that right, it now appears, presupposed the fact of the landlord having previously attempted to raise the rent on a recalcitrant tenant. The instance is not one of the first importance, perhaps, but it illustrates not unaptly the difference between the exegesis of Mr. GLADSTONE himself as applied to his words and the exegesis of impartial as well as partial outsiders.

A more remarkable occurrence was the PREMIER'S startling relapse on Thursday from the conciliatory position which may have been suggested by the division on Mr. HENRIAGE'S amendment. However this may be, the facilities which the Government sought were, as has been said, granted to it with hardly any hesitation. The woe of private members in consequence of this complaisance have been more than sufficiently bewailed. Actually, counts out on Tuesday and Friday night have been the rule, except when, as on Friday week, it suited the purpose of the Government to make the private member a stalking-horse for their own ends. The postponement of the Transvaal debate is so obviously to the advantage of the Ministry that they cannot be blamed for utilizing the presumed necessity of the Land Bill to lengthen it at their pleasure. A question has been raised which is at once natural and innocent (two words which in different forms of dialectic English have an identical connotation) as to the reasons which induce Parliament to put itself to these extraordinary pains in order to secure the passing of a measure which, if members voted untrammelled, would probably have been rejected on the second reading by an immense majority. The Circular (now in print and undeniable) of the National Liberal Federation explains part of the difficulty; the patriotism and statesmanship which still distinguish some members of the Parliament of Great Britain explain the rest. The fear of the "Hundreds," and possibly some lingering remnants of the intoxication of the General Election, assure Mr. GLADSTONE of a certain majority from among his own followers. The knowledge of the state of things which his misgovernment has brought about in Ireland prevents his opponents from opposing the measure as obstinately as they might otherwise be inclined to do.

Although the critical Clause 7 has now been reached, the comparatively conciliatory attitude which the Government adopted after their warning of Thursday week has been fairly maintained. The limitation of Mr. GLADSTONE'S concession as to the right of the landlord to approach the Court is much to be regretted, because it reascitates one of the most objectionable features of the Bill—the odium thrown by it on the landlord who wishes to let his land at a fair rent, but not more or less than a fair rent, while he is unwilling to injure his family by permanently diminishing the value of the property. The struggle between Mr. SMITH and the Ministry on the proportion of compensation to rent was decided as far as the principle went in favour of the Opposition, though on points of detail the Government enjoyed and availed themselves of the advantages of their majority. The upholding, however, of the provisions of existing leases is a favourable sign, and may be thought to augur fairly of the intentions of the Government as to a very momentous question—the question of arrears. Some of the changes which were effected in the Bill during the earlier part of the week were for the most part improvements, though not many of them were of great importance. The opposition which the Government made to proposals whereby the landlords might have been enabled to benefit farm-labourers without exposing themselves to a heavy mulct was not so unreasonable as it may have seemed. The present agitation has not biased itself with the labourers, and in their grievances a valuable focus of future disturbance may perhaps be foreseen. Besides, the whole tendency of the present legislation is to dissociate the landlord from any interest in a fellow-feeling with the dwellers on his estate. It appears to be thought by the Government or their advisers that the best thing that can be done for Ireland is to convert the present landlords into absentee holders of a moderate rent-charge, the payment of which will excite no more unpleasant feelings than the payment of a ground-rent by a householder who enjoys a long lease excites at present. Improvements on the part of the landlord, interest in the labourers, gratuitous lowering or abatement of rents, and other features of "English management" are therefore distinctly to be deprecated, and any provisions which have them in view are consistently opposed. The probable effect of this policy on the future of Ireland is not doubtful to experienced and dispassionate observers; but the logical and consistent upholding of it cannot be justly made a ground of complaint against those who have committed themselves thereto.

This policy which, though persistently enough pursued by the Ministry, has never been openly announced or ex-

ained by them, is enunciated almost without any disguise some of their supporters. The theory of an ancient partnership between landlord and tenant in Ireland, unsupported as it is by the slightest historical evidence, and directly as it is contradicted by an unbroken *catena* of evidence of the legal kind, finds much favour with some advocates whose ignorance may possibly excuse their audacity. Mr. GLADSTONE contents himself for the most part with the safer but equally useful hypothesis of a right in the holding, created intentionally or unintentionally by the Act of 1870. But both those theories and some others reduce themselves in the long run, and have sometimes been explicitly reduced by courageous reasoners, to the simple proposition that the landlord is the sleeping, the tenant the active, partner in an ordinary business concern, the profits of which, for some reason not given, ought to be assigned at intervals between the *societates* by a publicly instituted tribunal. This idea finds a stammering and imperfect expression in the Land Bill itself; but it is openly enunciated in one form or another by all defenders of that measure. The thought is not unnaturally suggested that some simpler means, similar to those now in use in the matter of tithes, might accomplish the end. But this suggestion ignores the fact that the object thus nakedly stated might not commend itself even to a Parliament sufficiently subservient not to resent the dictation of the busybodies of Birmingham. Nor should it be forgotten that, though public attention has naturally been concentrated on the confiscatory portion of the Land Bill, it has other portions which are of far greater, if of equally debatable, moment to the future of Ireland. The creation by State interference of a peasant proprietary, the reclamation of waste lands, the carrying out of great engineering works, the promotion of emigration, and the distribution of the people to new centres are proceedings very questionable in the eyes of some English critics, but questionable in a way entirely different from the questionableness of the earlier clauses. They may be unwise; they cannot be said to be unjust. They may be impracticable or doomed to failure; they cannot be said to be demonstratively certain, if successful in their working, to be productive of harm and not good to the country. It has been evident all along that the Government attach much less importance to these clauses than to the clauses crippling and mulcting the landlords in respect of the rights which in many cases Parliament has induced them to purchase within the present generation. But they are ostensibly pledged to the whole Bill, and it would be somewhat unfortunate if advantage were not taken of the pledge such as it is.

THE IRISH IN AMERICA.

IT is not known whether any formal remonstrances have been addressed to the American Government on the subject of the Fenian plots and outrages which are organized without interference in the States. It will, perhaps, not be judicious, by urging demands which cannot be enforced, to furnish Mr. BLAINE with opportunities of courting popularity. The American papers generally anticipated the answer, if not the question, by contemptuous statements that their Government would not undertake to do the work of the English police. The case of the *Alabama* is perhaps not forgotten, but it is regarded only as a one-sided precedent. A claim of some hundreds of millions was advanced against the English Government for not doing the work of the American police; and ultimately a penalty amounting to double the proved amount of damage was exacted by means of the Geneva arbitration. It was rightly contended, on behalf of the United States, that no Government can excuse dereliction of an international duty by any defect in its own municipal law; but in this respect also there are two weights and measures, varying with the real or supposed pugnacity of the litigants. It can scarcely be lawful in any civilized country to organize assassination or arson to be practised in foreign territory. When it was found many years ago in England that there was doubt as to the efficiency of the existing law, the statute under which the German criminal Most has recently been convicted, was passed to correct the omission. A public law, the promotion of civil war or of criminal

the authorities. It is not denied that the subscriptions are in part applied to incendiary enterprises such as the attempts to blow up the Mansion House and the Liverpool Town Hall. It is more doubtful whether the mendacious ruffian who lately claimed for his accomplices the merit of the *Doterel* explosion on that occasion deviated into truth. The bulk of the fund probably passes into the hands of the Land League, which derives almost all its resources from the United States. General GRANT does himself some credit by deprecating the wanton and brutal outrages of which the Fenian ringleaders boast. The American Government will probably share his opinion that it cannot interfere except on legal proof of complicity in some definite crime.

A reason for not too strongly resenting tolerance of criminal agitation may be found in the habitual indifference to violent language which is a respectable characteristic of the American people. It is only when declamation results in disorder that demagogues are forcibly reduced to silence. The outrages of the Fenian conspirators are perpetrated at a distance from the places in which they deliver inflammatory harangues. It may be added that respectable Americans neither frequent Fenian meetings nor read the papers which are circulated among the Irish rabble. It is not without surprise that they learn from English reports the atrocious schemes which are devised by the conspirators who live in their midst. The perversity and folly of the Fenian enterprises probably diminish the feeling of indignation which they might otherwise excite. Attempts to destroy a few public buildings, with the incidental slaughter of casual passengers or bystanders, seem to have no political tendency. The Manchester murder and the Clerkenwell explosion were undertaken for the definite object of releasing criminals; but there were no Fenian prisoners in the Mansion House or the Liverpool Town Hall. It is not advantageous to Irishmen living in England that they should be associated in public estimation with incendiaries and assassins; but Americans are mistaken if they assume that extreme folly is incompatible with serious mischief. The irritation which is caused in England by the impunity accorded to the ringleaders ought to be known and understood. Not many years have passed since the Fenian conspiracy was officially encouraged by Federal authorities. A Fenian invasion of Canadian territory in General GRANT's time was neither prevented nor punished; and on one scandalous occasion the ostensible managers of the organization were formally received and welcomed by the House of Representatives. The disregard of decorum and good feeling is now much less conspicuous. The remaining indulgence which is shown to the conspiracy may probably be explained by the expediency of not alienating Irish votes at elections.

The intended visit of Mr. PARNELL and other Land League agitators to the United States will excite a certain amount of curiosity. If they hold exclusive intercourse with their Irish allies, including O'DONOVAN ROSSA and the other Fenian leaders, they may perhaps collect considerable sums of money; but their proceedings will be devoid of political interest. It remains to be seen whether any section of American politicians will profess sympathy with the faction which seeks the disruption of the United Kingdom. If it were possible to require any kind of consistency from political parties or communities, Americans of all denominations are bound to sympathize with those who are resolved to maintain national integrity and unity. The civil war of twenty years ago was conducted to a successful issue by the Northern Americans on the principle that neither positive laws nor ideal aspirations should be allowed to prevail against the principle of the indivisibility of the Republic. The separation of Ireland from Great Britain would be more ruinous than the permanent establishment of the Southern Confederacy. That the enemies of England should openly solicit and occasionally receive foreign aid is not a little offensive. There seems to be a certain reaction in American opinion against the Irish demagogues, and they will be embarrassed by the necessity of using violent language to suit the taste of their own special partisans. Scrupulous advocates of the supposed interests of Irish tenant-farmers will not venture to disavow the doctrine that private war is to be waged with England by means of "the resources of modern science," which is another name for dynamite and infernal machines.

It is sometimes difficult to avoid a shock to the susce

bility of American patriotism in criticizing the working of institutions which are perhaps not thoroughly intelligible to foreigners. The feud between the PRESIDENT and the late leaders of the Republican party in the Senate seems slightly ludicrous to those who perhaps imperfectly appreciate the sound political condition which it indirectly denotes. No great country could afford to indulge in disputes so apparently trivial, if it were exposed to a risk of grave political disturbance. When Americans consider any issue to be of vital importance, they are neither timid nor weakly scrupulous in correcting what may be amiss. Neither the Union nor any separate State within its borders would have tolerated, in deference to cant and prejudice, the disorder which has prevailed in Ireland during the last year. If one form of coercion had proved insufficient, more stringent remedies would have been applied, and murder and outrage would at all hazards have been repressed. Not many months have passed since a kind of Land League, which had been established by gangs of Irish miners in a county of the State of Pennsylvania, was effectually dissolved by the process of trying and hanging twenty or thirty of the ring-leaders. Two or three years ago a more formidable organization in the same State was reduced to obedience by the employment of a sufficient armed force. At the same time, there is no country in which verbal sedition enjoys more complete immunity. The language of the priests and lay agitators who conduct the Land League in Ireland might be safely reproduced in any part of the United States; but, when it was found that denunciations on the platform were habitually followed by acts of violence, the promoters of outrage, as well as their instruments, would be promptly punished. It appears that the Fenians in America have lately deprecated attacks on English authority in Ireland, on the ground that they would be met by forcible repression. They profess to incline rather to explosions and other employments of modern scientific discoveries in England; but such outrages, if they are often repeated, are not likely to promote Irish interests. The immigrants who profess unqualified hostility to the country in which they earn their livelihood are already not universally popular with their English fellow-workmen. If they openly profess sympathy with the destruction of English life and property, they may perhaps find that the consequences are not advantageous to themselves. It is probable that future elections in large towns will disabuse Liberal candidates of the belief that it is for their interest to court the Irish portion of constituencies by affectation of partial complicity with the Home Rule Association or the Land League.

ARMY REORGANIZATION.

THE three points to which Colonel STANLEY confined his criticism of Mr. CHILDERS'S Army Reorganization Scheme are the points in which the non-military public is chiefly interested. A measure of this kind necessarily involves a certain amount of change in the status of various classes of officers, and the army is well enough represented in the House of Commons to ensure the claims of each of these classes full, if not satisfactory, consideration. They do not, however, evoke any emotion outside the army beyond a general desire that individuals shall be properly compensated for any disadvantage inflicted on them for public ends. What civilians want is simply adequate protection against external dangers, and an adequate return for the money spent in obtaining this protection. So far as the army is concerned, this adequate protection means the possession of enough good soldiers to defend an immense frontier, and to make an effective attack in those occasional cases when attack is really the best or even the only means of defence. But a commercial people may be forgiven for wanting something more than this. They want to be assured not only that they have as good an army as they need have, but also that it does not cost them more than it need cost. It cannot be said that on either of these points the public feel or ought to feel very confident. The possible demands upon the army are easily reckoned up, but in the calculation how they are to be met, a great deal has to be left to chance. We know that at a time to time a sudden call is made upon us in India, South Africa, and that by immense and costly efforts we contrive more or less imperfectly to make answer

to it. Happily these calls have never coincided with any similar summons in Europe, but it is impossible to contemplate the contingency of their doing so without grave misgiving. At present neither of the main objects for which the English army exists is completely attained. We have neither a very small but very good army, nor a moderately good but very large army. If 20,000 picked soldiers could be sent at a moment's notice to any part of the world, it would count for something. If 200,000 moderately trained soldiers could be gathered round the colours within a short interval from the day when war was declared, it would at least ensure safety against sudden surprise. A long service system is the natural way to give us the former advantage, a short service system might be made to give us the latter; and, considering how much may depend upon our having both, seems obvious that the two systems ought to be maintained side by side. Instead of this, we have hitherto tried them one after another, and now we are going to try them in combination. The French and German war startled us out of long service; Zulu and the Afghan wars startled us out of short service. The one showed that, if we should ever be engaged in a European war, the drain upon the army would be far greater than could be borne without a proper reserve; the others showed that the conditions of Indian and African warfare could not be satisfied except by a permanent supply of thoroughly seasoned troops. We are now going to make the term of service with the colours a little longer than it has been under short service, while leaving it a good deal shorter than it was under long service. Where is the guarantee that under this combination either of the ends the military authorities are supposed to have in view will be secured? The probability we fear is that the years a soldier will now have to serve will make recruiting more difficult; while they will not make the recruits we get very much more efficient.

The principle which underlies the new territorial organization of the army is clearly the right one. The more closely particular regiments are associated with particular districts the more likely it is that recruiting will go on briskly, and that the recruits will bear themselves bravely. The regiment will not be a strange world to the newly-joined soldier. In peace he will mix with men who speak the same dialect and have the same local knowledge. In war he will go into action under the eyes of men who have come from the same county, perhaps from the same parish, and who equally with himself will go back thither when they leave, or when their term of service is over. The association of the regulars, the Militia, and the Volunteers in each district will help on the same good result. Volunteers and Militia will be familiar with the regiments with which they are linked, and if they have a genuine turn for soldiering they will be the more likely to exchange the less for the more exacting form of service. But these undoubted gains might surely have been secured with less of outward and visible change than has actually been introduced. What was really wanted was simply that particular regiments should be recruited from, and have their depôts stationed in, particular districts. There was no need that the name of the regiment should be made local as well. There is nothing, of course, in a numerical designation apart from the history which has grown up round it; but when a history has grown up round it, it ought to be preserved with as much care as though it were an old family name. It may be highly desirable that the "50th Regiment" should take East Kent for its recruiting ground, but the young men of East Kent will be no more eager to enlist in the East Kent regiment than they would have been in the 50th. The same argument holds good of such slight distinctions as are given by the colour of the facings. The Buffs, for example, are to retain their name, but their facings are to be altered to white. There may be good reason for clothing a whole army in cloth of the same colour, because it marks the unity of the entire force serving under the same standard. Even this consideration, however, has been rightly passed over in the case of the Highland regiments, and the exception to uniformity might innocently have been extended from Scotch tartans to English facings whenever there was cause to do so. The fact that the colour of the facings has given a name to a regiment certainly seems to supply such a want. The Buffs has hitherto been an appropriate name, and will hardly remain so when the name is derived from a colour.

A more difficult problem is connected with the question of compulsory retirement. This is a remedy for which there is absolutely nothing to be said unless it can be shown that it is the only medicine which will cure the disease. It is either indispensable or foolish. The two most obvious objections to it are that it deprives the army of the services of a large number of qualified officers in the prime of life, and that it prevents a poor man from regarding the army in the light of a permanent career. If an army were being created on paper, every officer would get his promotion just when he attained the proper age. There would be no delays to vex or dishearten him; each step would come precisely when he had served the right number of years to qualify him for passing to a higher rank. In the actual army things go very differently. Instead of a constant and well-graduated movement upwards, there is a hopeless block. Nobody makes way for anybody else, and as there are no vacancies to be filled no one can be appointed to fill them. In future this state of things is to be dealt with in a very thoroughgoing way. As a rule, every officer will be compelled to retire on reaching a prescribed age, unless he by that time holds a prescribed rank in the service. In this way the requisite number of vacancies will be perpetually created, and the requisite flow of promotion maintained. It will be maintained, however, at a very heavy cost—a cost which may conceivably be fatal to the end for which this cost is incurred. No doubt the knowledge that a man may remain a captain all his life is not calculated to make the army a popular profession. But is the knowledge that a man may arrive at the rank of captain, and then be thrown upon the world with nothing to do and only his half-pay to live upon, any better calculated to make the army a popular profession? That is a question to which the answer seems exceedingly doubtful. Even if it be conceded that compulsory retirement is the only expedient that has yet been suggested for securing a due flow of promotion, it must still be regarded as an expedient which simply substitutes one evil for another.

THE STATE TRIAL AT CONSTANTINOPLE.

THE State trial at Constantinople has ended earlier than had been expected. It cannot be said that the proceedings or the result are satisfactory. It is not necessarily to the discredit of Turkish justice that it is administered on principles which are not recognized in England, if only the truth is with approximate correctness ascertained; but it may be worth noticing that the evidence against the principal persons who are charged with participation in the murder consists wholly on the declarations of professed accomplices. The two MUSTAPHAS who, according to their own account, were the actual assassins, had not, if their story was true, held direct communication with the Ministers who are said to have plotted the murder. Even if their testimony had been more positive, they were accusing accomplices who were not inculpated by independent testimony. It is perhaps not incredible that vulgar ruffians should be hired by Oriental courtiers and statesmen to kill a fallen sovereign; but, on the other hand, it is equally probable that the SULTAN or his present advisers should by questionable methods seek to rid themselves of possible enemies and rivals. Nothing would be easier than to induce two disreputable adventurers, such as the self-accused murderers, to include formidable personages among the perpetrators of a crime which they professed to have themselves committed. According to their statement, they murdered ABDUL AZIZ for a payment to each of 100*l.*, and a small pension charged on the civil list. Turkish ways are not always intelligible; but the inscription of a name on the pension list seems an odd way of rewarding a murderer. If a pardon has been secretly promised to the wrestler and the gardener, it may perhaps also be accompanied by a pension. The three palace attendants who saw the transaction are not exempt from suspicion. It would seem that during five years they have not divulged the story of their crime, and they are suddenly forthcoming just as their evidence is wanted.

A main part of the story is that a Commission, appointed for the purpose, determined that ABDUL AZIZ should not be allowed to survive his deposition. However, the Commission deny that any such Commission was appointed, and it is probable that in such authority

even to a Committee selected amongst themselves. It cannot be denied that they might be impelled to commit the crime by intelligible motives. It was not impossible that ABDUL AZIZ might recover his throne; and it was certain that, if he had the power, he would revenge himself on the agents of his dethronement. In times when the state of European society perhaps resembled the present moral condition of Turkey, the saying that dethroned kings were not destined long to survive almost passed into a proverb. The conclusion that it was for the interest of a man to get rid of a dangerous enemy may perhaps be accepted by a Turkish tribunal as sufficient proof that the object of his fear and hatred died by his contrivance. It is not a little surprising that although the Court has not condemned the ex-Sultan MURAD as an accomplice in the crime, he was inculpated by the same evidence on which the prisoners were convicted. In the abbreviated report of the trial there is no special mention of the charge against MURAD, but it was probably considered that he would have fallen a victim to ABDUL AZIZ's revenge if a restoration had been effected. It follows, according to a certain kind of judicial logic, that ABDUL's successor must have shared in the crime which offered him a certain security. According to all previous statements, MURAD was so much alarmed by his sudden elevation and by the circumstances which preceded it, that from the moment of his accession he became incapable of discharging even ceremonial functions. MIDHAT and his associates, who had the strongest motives for keeping their nominee on the throne, were obliged once more to change the succession by substituting for the imbecile SULTAN a Prince who has since displayed considerable ability of a mysterious kind. It would therefore seem probable that MURAD is innocent, though the charge of assassination may render him incapable, if he recovers his faculties, of disputing the succession with the present SULTAN. If, again, the Court has convicted MURAD on mere conjecture, or in deference to superior order, its judgments against the other prisoners are open to suspicion.

MIDHAT PASHA and his associates in the deposition of ABDUL AZIZ cannot but have known that the position of a king-maker is in the highest degree perilous. The reigning Sovereign is not likely to forget that his patron has once disregarded a title as sacred as *his own*. ABDUL AZIZ was dethroned or forced to abdicate because his misgovernment was dangerous or ruinous to the Empire. ABDUL HAMID may not have felt confident that similar imputations might not at some time be brought against himself, with a like result. It was in this frame of mind, according to SHAKESPEARE, and perhaps according to more prosaic historians, that HENRY IV. regarded the PERCYs who had substituted BOLINGBROKE for RICHARD II. The reasons of State which may perhaps have justified MIDHAT's bold enterprise are not likely to affect the judgment of the present SULTAN. ABDUL AZIZ had during the latter part of his reign fallen wholly under the influence of General IGNATIEFF, who for well-known purposes encouraged him in every act which could endanger his own position and the prosperity of the Empire. It was known that the suspension of payment of interest on the debt was instigated by the Russian AMBASSADOR, who was at the same time encouraging the insurgents in Herzegovina, and preparing the outbreak of the Servian war. It has been frequently asserted that the SULTAN had been persuaded by his insidious counsellor to invite a Russian army to occupy Constantinople. With a deadly enemy preparing for a decisive blow, Turkish statesmen kept or believed that their own Sovereign was purposely unconsciously in league with Russia. In these circumstances MIDHAT determined both to change the occupant of the throne and to remodel the institutions of the country. When MURAD became Sultan, the absolute government was modified by the institution of a Parliament. The scheme was at the time exposed to not unlaughable ridicule; but the Turkish Assembly displayed untiring patriotism and public spirit. When, at the end of the law, the Russian Ministers and Generals had Turkey at their knee, one of their first demands was the abolition of the autocracy. On the whole, the deposition of ABDUL AZIZ may have been expedient and justifiable; but a law that enterprise may possibly be consolidated by a crime. Two MIDHATs were probably right in deposing ABDUL AZIZ, but a conclusive proof that he was innocent of a such crime. Act of

The real facts of the case will probably always

doubtful. The short trial has added little to previous knowledge or conjecture. In such countries as Turkey circumstantial evidence is more satisfactory than many kinds of positive testimony, including confessions by alleged accomplices. Of eyewitnesses the most respectable are the European physicians who at the time certified to the probability that the ex-Sultan had committed suicide. It has, indeed, been stated that they were not allowed to see the body uncovered; but, if they had any regard for their professional character, they would have withheld their certificate until they were allowed to use all proper means for ascertaining the truth. As the attendance of some or all of them might have been secured, the failure of the prosecutor to call them implies a belief that their testimony would have been favourable to the prisoners. Nevertheless, it cannot be affirmed that the accused prisoners are innocent, though the balance of probability inclines against their guilt. It seems probable that the immediate occasion of the inquiry was not the unexplained self-accusation of the alleged murderers. The SULTAN, who is prone to be habitually apprehensive of personal danger, was not unnaturally shocked and frightened by the atrocious murder of the Emperor of RUSSIA. He may probably have resolved to make a conspicuous demonstration of the vengeance which awaits regicide for the purpose of terrifying domestic enemies who might possibly meditate designs against his own person. The supposed disclosures of the parties to the tragedy of ABDUL AZIZ's death furnished the needed opportunity. The trial and the sentence on the former Ministers and their supposed confederates will have impressed the dullest Turkish imagination. One of the convicted prisoners is the SULTAN's brother and predecessor; two of them are his brothers-in-law, one of the two having long been his most confidential adviser and favourite. MIDHAT is better known in Europe, and perhaps in Turkey, than any of his countrymen; and he has for some years held one of the most considerable provincial governments. His bearing at the trial was worthy of his rank and reputation; and his conviction will satisfy no impartial person of his guilt. Ambitious revolutionists or reformers have now received full notice that Sultans are not to be dethroned with impunity. ABDUL HAMID himself is the only person in the Empire who has derived advantage from the deposition of ABDUL AZIZ, without incurring the penalty which is to be paid by those who placed him on the throne.

M. DUFAURE.

THE long and honourable career of M. DUFAURE has come to an end; and, although he has retired from public life since M. GRÉVY became President, his death reminds France that she has lost a most valuable servant and protector of the State. M. DUFAURE was always ready to serve when he could serve usefully and conscientiously, and always vigilant when he saw danger threatening the constitutional liberty to which he was pertinaciously devoted. He served under LOUIS PHILIPPE, he served under LOUIS NAPOLEON when President, he served under Marshal MACMAHON. He was a resolute opponent of the Liberals who got up the Reform banquets of 1848, of the Government of the *Coup d'état*, and of the Government of the Fourth of September. He had no predilection for Monarchy or against it, for the Republic or against it. All he asked was that the government which cited him to join it should be a government that kept itself within the law. His commanding position at the bar, his homely direct oratory, his gift of scathing epigram, his incorruptible integrity, even the simplicity of life which kept him apart from the pleasures, passions, and the scandal of Paris, made him a man whose name and co-operation gave strength to the Government after government which happened to wish to move in a modest and constitutional direction. He constantly disappointed those of his friends who expected that he would never league himself with rivals whom he and they had been opposed, and those of his friends who predicted that when he had gone one step in the expected direction he would take two. Such a man, whose long enough to give the impression of perfect rectitude, may be respected, but he cannot be widely followed. It was no special perversity in the fact that made them always speak and think of M. DUFAURE as a politician of the second rank.

man without initiative, without originality, without sympathy, is not a statesman at all. M. DUFAURE was every subordinate and secondary sense. He escaped reproach because he never faced difficulties. He neither felt the aspirations nor would assume the responsibilities of a chief. He was always the colleague—the respected, the useful, the high-minded colleague—of some one else. Such men are naturally, and perhaps deservedly, more honoured when they die than when they live. They have been so useful, and their usefulness is for ever ended. But it is more sentimentalism to speak as if they ought to have been more honoured in their lives, and as if it is only through ignorance and blindness that a nation does not lean on them with implicit confidence. There is not enough in them for a nation to lean on. They are excellent guides when the question of the moment is what ought not to be done. But, when the question is what ought to be done, they retire into the background, and leave the front of the stage to those who can play a higher and more difficult part.

M. DUFAURE entered the Chamber in 1834 as deputy for an arrondissement of the Charente Inférieure. He was already in good practice as an advocate at the Bordenaux Bar, and before many years had passed he was offered and accepted the post of Minister of Public Works. He was, perhaps, as much in harmony with the somewhat pedantic and formalist constitutionalism of M. GUIZOT as with the principles and tendencies of any of the numerous governments he was destined to join. While he held office the railway system of France was planned and its execution begun, and no one had more to do with the general design of this system and with the creation of the peculiar legislation which controls it than M. DUFAURE. He was quite satisfied with the state of things that existed in the latter days of LOUIS PHILIPPE, and believing that the essentials of constitutional government had been secured, was not only indifferent, but averse, to all demands for further reforms. When told that the Ministers ought to be impeached for prohibiting the Reform banquets of 1848, he replied that they certainly would have deserved impeachment if they had not prohibited them. Of all men in France, he least desired to see a Republic established; but, when it was established, he had no kind of objection to place his services at the disposal of General CAVAIGNAC. He did what he could to support the candidature of CAVAIGNAC, thinking him, not only honest, but more likely than any rival to keep within the bounds of legality and to refrain from all schemes of personal aggrandizement. France decided that LOUIS NAPOLEON should be President. As M. DUFAURE said at the time, it preferred a name to a man. However much he may have regretted this decision, M. DUFAURE could not but recognize that LOUIS NAPOLEON was legally elected; and, until the legally-elected President did something wrong, he felt no scruple in accepting office under him. When the President showed that he was going to walk in a new and very unconstitutional path, M. DUFAURE retired; and, joining the constitutional Opposition, was one of the victims of the *Coup d'état*. He was imprisoned in Mont Valérien; but, having peculiar family reasons for desiring liberty for a few hours, he applied for and obtained permission to absent himself under an engagement to return. At the appointed hour he came back, but was told that he was not to be readmitted. Furious at this attempt to cheat him out of imprisonment, he went off to the Duke de MORNY, and insisted that he must be allowed to fulfil the engagement into which he had entered. The DUKE, however, was equally polite and firm, assured him that he was not thought in the least dangerous, and declared that the Government had been only too delighted to see him walk of his own accord out of a prison in which it was very embarrassing to the DUKE and his friends to have had to place him. Nothing could have better shown the character of the man. His first thought at every critical moment was what it was right for him personally to do. It shocked him that he, as a man of honour, should not be allowed to prove that he always kept his word. Dreadful to him as a constitutionalist as was the calamity which was befalling France, it was still more dreadful that he should seem to be escaping by the connivance of the Government from sharing the fate of his friends.

During the Empire he attained to a high position in the Paris Bar, where his unrivalled knowledge of law and his

and in 1862 he was admitted into the Academy. The ground of his admission was his oratorical power, and M. PAIN, who pronounced the customary discourse on his reception, gave one of those laboured and analytical descriptions of M. DUBAURE's style which would be wearisome to an English audience, but which commend themselves to French taste. The gist of the criticism was that the eloquence of M. DUBAURE was totally devoid of ornament, that it was closely and rigidly logical, and that the reason why it impressed those who listened to it was that it was so obviously the utterance of an honest man. After the war M. DUBAURE became the colleague of M. THIERS, and was the only colleague of M. THIERS over whom that impetuous and meddlesome statesman did not dare to tyrannize. He alone would not allow M. THIERS to intrude into the affairs of the department, that of the Keeper of the Seals, with which M. DUBAURE had been entrusted. He positively refused to let M. THIERS name a magistrate, and as he did no jobs on his own account, he would allow no one else to do them in his name. He was so sensitive to any accusations of favouritism, that it was a common remark at the time that applicants for posts had to give away had no chance if they had ever spoken to him. When the struggle with the Commune broke out, no one was more vehement than M. DUBAURE in insisting that no idea of a compromise should be entertained, and that the most rigorous measures should be taken with the insurgents after they had been defeated. He abhorred saviours of society who went beyond the law, but within the limits of the law saviours of society were men after his own heart. When M. THIERS was supplanted by Marshal MACMAHON, M. DUBAURE was as usual as ready to serve under the new man as the old, quitting the MARSHAL when the very unconstitutional Government of Combat was formed, and returning to the MARSHAL's side when this Government was defeated, and the MARSHAL submitted himself, and once more came back to legal and constitutional ways. When the MARSHAL finally retired, M. DUBAURE retired also, not because he had any antipathy to M. GREY, but because he was eighty years of age, and saw that the time was come for new men. An end must come some day to the process of joining and quitting every successive government, and the peculiar glory of M. DUBAURE is that he continued this process for forty years, and that at every stage public opinion recognized that, whether he joined a Government or quitted it, he was always actuated by the purest motives. He had at once a pliability of conduct and a tenacity of principle, the union of which is rare in France, as it is in every country, but is known there as much as it is known elsewhere. He presented a type which has long existed among Frenchmen, which is to be found in many walks in private life, and which is still as likely to endure in France as it ever was. At bottom the virtues and merits of M. DUBAURE were the virtues and merits of the best of the French *bourgeois*. In many country towns of France there live honoured and do lamented men of inglorious DUBAURE's, men known as adroit, pliable, patient, laborious, always to be found, and always available when wanted, ready to go up to a certain point with one neighbour or another, and yet personally scrupulous, and punctiliously avoiding, from high motives, everything that could entail dishonour or impose perilous responsibility.

SAUNDERS v. RICHARDSON.

THE case of SAUNDERS v. RICHARDSON, which was decided in the Queen's Bench Division on Monday, will take a high place among the curiosities of educational jurisprudence. The plaintiff represented the School Board of Belgrave, in Leicestershire; the defendant was the ingenious father of a child named AMY, whom, as was alleged, he did not cause to attend school as required by the by-laws in force in the parish. The defendant contended that this allegation was false. There had indeed been a time when he had not caused the child to attend school; but, under the gentle pressure of an attendance order from the magistrates, he had mended his ways, and from the 21st of August, 1880, down to the time of the information being preferred against him, he had regularly sent her to the Board School, with a request that she might be admitted and instructed. On each such occasion, however, the child was refused admission, on the ground

that the rules of the school required the school fee to be prepaid, and consequently that it was not enough for the child to present herself unless she also presented herself with the money in her hand. In the first instance, the offence charged against the defendant was disobedience to the attendance order issued by the magistrates. To this charge he pleaded that he had sufficiently obeyed the order by sending his child to the school. To pay the fees was out of his power; but all that he could do he had done, and the law does not require impossibilities. Mr. Justice LINDLEY and Mr. Justice LORES held that this constituted a good defence, and the case was dismissed. Thereupon the School Board raised the question afresh in a slightly different form. Instead of charging the defendant with disobedience to the order of attendance, they charged him with disobedience to the by-laws providing that every child within school age shall receive instruction for a specified number of days in each year. Even if attendance at school could be accomplished by sending the child to the school door, receiving instruction, they argued, required that she should come and remain inside; and, as the defendant had not taken the necessary steps to cause her to come and remain inside, he was guilty of a breach of the by-law. The magistrates held, however, that the two offences were substantially identical, and that their action in the second case must be governed by the decision of the Queen's Bench Division in the first case. They accordingly dismissed the summons, but again stated a case for the decision of the Court. On Monday five judges sat to hear the arguments. The ATTORNEY-GENERAL, who appeared for the School Board, contended that the decision in the former case was wrong. The Education Acts impose upon a parent the duty of seeing that his children receive education. If he chooses to perform this duty by sending them to school, he must do all such things as will ensure their admission when sent. One of these necessary things is to pay the prescribed fees, or, supposing payment to be impossible by reason of poverty, to have them remitted. The defendant had done neither of these things, and he consequently could not be held to have obeyed the law, which, since the Act of 1876, requires that every parent shall cause his child to receive instruction. On the other side it was argued, with much ingenuity, first, that the case ought not to be reheard, since the Judicature Act expressly provided that the decision of the Divisional Court should be final, and this decision had been given by Mr. Justice LINDLEY and Mr. Justice LORES. When this contention was overruled, on the ground that all that the Judicature Act meant was that the decision in the particular case was to be final, the counsel for the defendant next urged that the Education Act of 1876 was not the statute on which the information proceeded. The defendant was charged with the breach of a by-law made under the Education Act of 1876, and the provisions of the later Act ought not to be imported into the controversy. The charge was not that the defendant had not caused the child to receive instruction, but that he had not caused the child to attend school. Moreover, the by-law said nothing about the prepayment of fees, and if the omission to prepay them was to be made a criminal offence—as in effect it was now sought to make it—the obligation ought to be specifically stated. The provision enabling the School Board to remit the fees pointed out a method in which a father, desiring that his child should receive instruction, might get what he wished when he was too poor to pay for it. But the statute did not compel a poor parent to adopt this method, and consequently the defendant was not criminally liable for omitting to adopt it. He had done what he had been ordered to do by causing his child to attend school. If he had been wrong in not causing his child to receive instruction as well as attend school, he ought to have been proceeded against under the Act of 1876 and not under the Act of 1870.

This last argument infers the counsel's belief that the defendant had clearly broken the law, though there might be some doubt whether he had broken the precise law which he was accused of breaking. It would have been a momentary victory if the School Board had been convicted of carelessness in their selection of the statute, under which to proceed, and there was at least the chance that they might give up the contest in sheer disgust at two successive defeats. Unfortunately for this theory the Court held that the Acts of 1870 and 1876 must be construed together, and that attendance under the Act of

1870 must be taken as defined by the Act of 1876. Thereupon the fabric ingeniously raised for the defence came at once to the ground. "The attendance order," said Lord COLERIDGE, "was an order for the child to attend the school to receive the required instruction, and the duty of the parent was to cause the child to attend to receive such instruction." No doubt the performance of this duty may be excused by the magistrates if they are of opinion that there is a reasonable cause for the child's non-attendance. But when once the order has been made the parent is bound to satisfy the magistrate that he has obeyed it, or has at least made reasonable efforts to obey it. In this case the defendant had done neither. He had not caused the child to attend school to receive the required instruction, because the payment of the school fees was a condition precedent of so doing, and he was too poor to pay them. He had not made reasonable efforts to obey the order, because he had not made proper application to have the fees remitted. In the opinion of the LORD CHIEF JUSTICE, therefore, the decision of Mr. Justice LINDLEY and Mr. Justice LOPES was a wrong decision. They had held that an attendance order was obeyed by sending a child to the school door. He held that attendance meant effective attendance, and, consequently, that a father was bound to do what was necessary to ensure that the child would be admitted when sent. With this definition the other Judges concurred. Mr. Justice DENMAN held that in the Act of 1870 the words "cause to attend" were used in a sense different from the ordinary sense, and that they meant sending the child with the school fee in its hand. Mr. Justice WATKIN WILLIAMS described the act of the defendant as causing his child to make an abortive attempt to attend school, whereas what the law requires is that he shall cause it really to attend. The case was, therefore, remitted to the magistrates to see that the defendant obeys the law for the future.

If the decision of the Court had gone the other way, it might have been found necessary to have passed an Education Act Amendment Act during the present Session. The payment of the school fees is usually the least point of the causes which prevent a parent from sending a child to school. If he is really poor, he has seldom any difficulty in getting the fees remitted; what he cannot get remitted is the loss of the child's services or the trouble of seeing that it goes to school when it is sent. Had it been held that a parent could not be compelled to apply for remission of the fees, and that he had sufficiently complied with the law by regularly sending his child to the school door without them, an order of attendance would have meant nothing at all. Whenever a parent found it more convenient to keep his child at home, he would have taken care to obey the law by sending it every morning to demand a free admission. When this amusing and not burdensome ceremony had been gone through, the child would have been sent or put to work, and its wages, or the value of its services, would have been duly credited to the parent's account. Even in such a Session as the present, so odd an interpretation of the whole drift and intention of recent educational legislation could hardly have been allowed; and the House of Commons may be congratulated on being spared a troublesome piece of business when its hands are already over-full.

BULGARIA.

A CORRESPONDENT of the *Standard* has succeeded in obtaining from the Prince of BULGARIA a full exposition of what the PRINCE wishes to be understood as his case in his present struggle with his subjects. The PRINCE appears to have been delighted at being "interviewed," and thought himself very lucky in having a really good opportunity of telling all his long sad history to Western Europe. On no point was he more earnest than in his own profound reluctance to accept the post which was forced on him. Directly he heard he had been elected, he told the German EMPEROR that the Bulgarians might ask him to come, but that nothing would induce him to go. His chief cause for shunning the proposed honour was the absurdity of the Constitution to which he was to be asked to swear. It had been drawn up by a Russian Prince with vague democratic leanings, and had received its final touches from a group

of Bulgarian democrats at Tirnova. He saw that such a Constitution would never work, and that it necessarily placed all power in the hands of cliques of needy adventurers who had no real influence, and no other ambition than that of gaining petty personal advantages. In such a scheme there was no tenable place for an honest German Prince. But he was not his own master; and when the Czar insisted that he must become a Prince, and swear to a Constitution, whether absurd or sensible, he went and swore. Russia was bound to find a Prince for the Bulgaria she had created, and Prince ALEXANDER of Hesse was the only Prince that Russia would name and Austria would accept. The PRINCE felt that he had been born under an evil star. He alone of all the millions of men was the possible Prince of Bulgaria. It was his doom, and he had to bear it. The brand of Bulgaria was on his brow; and, like CAIN or the Wandering Jew, he had to leave his once happy home and roam in the arid deserts and fetid marshes of Bulgarian Constitutionalism. Nor can he escape from his curse. It is always hanging over his head. After the death of the late Czar he made a tour to Vienna, Berlin, and St. Petersburg, explaining how very unhappy he was, how he loathed his Bulgarian Ministers, and how he must put an end to the ridiculous Constitution to which he had sworn. Everywhere he met the same answer. He might swear and unswear as he pleased; he might accept, break, or invent constitutions according to his fancy, but he must remain the Prince of Bulgaria. People who are cursed from the cradle must realize their position. There is no use in their whining over their lot, and all the three EMPERORS explained to the PRINCE that he had no kind of choice in the matter, and that stay he must. Sad and dejected, the doomed one went back to his detested Principality, and resolved that, if he had to stay on in such a place, he would at least see if a military *coup d'état* would not lessen his misery, and make life in Bulgaria more endurable.

His provisions as to the evils that would come upon him when he was left alone with the Bulgarians and their Constitution were more than realized. The mass of the people did not raise in him any peculiar feelings of aversion, and he thought the country full of natural resources and capable of improvement. But he had to deal, not with the mass of the people, but with the crowd of needy, greedy, ignorant, fanatical adventurers, with grand phrases on their lips and sordid aims in their hearts, who always come to the top in a country new to political life, and the PRINCE found that men like these cared about as much for the improvement of Bulgarian soil as they cared for the improvement of Jupiter. He tried a Ministry of the Right, and thought that he had got hold of the worst Ministry the world could furnish, until he tried a Ministry of the Left, and found that he had been wrong, and a worse Ministry was possible. Wrangles, intrigues, and jobs occupied all the time that should have been given to the service of the State. And there was one thing in the leading Bulgarians that shocked his honest German soul more than anything else. They were one and all such prodigious liars. They told him orders had been carried out that had not been carried out; they lied about everything; they lied about him, and said that stones ordered for the roads were being used for his palace, and that new taxes were imposed only to be wasted by him on his own personal luxury. And, then, every one was so corrupt. He could not find one righteous man in this new city of the plain. The administration was corrupt, the Courts were corrupt, the gendarmerie were corrupt to a man. If the PRINCE had attempted to introduce purity by dismissing the impure, he would have had to dismiss everybody; and how, as he piteously asked, could he possibly do that? When he tried to show those who surrounded him that the Constitution was a farce; that the mass of the people knew and cared nothing about it; and that they really looked to their PRINCE as they had looked to the SULTAN, his unpleasant friends replied that they had no objection to his use of any amount of personal power, so long as he used it to promote the jobs in which they themselves took an interest. There is no reason to suppose that the PRINCE was not speaking the truth. The Bulgarian Constitution was an absurdity. The Bulgarians were as unfit for democratic liberty as the Russians would be if it was given them now, or as Spanish colonists were when, half a century ago, they set up their Republics. Europe made the same mistake

in giving the Bulgarians more liberty than they could use, as it made in awarding Greece more territory than they could secure for her. If Bulgaria was left to itself, and the PRINCE went away, there can be little doubt that Bulgaria would rapidly pass through the stages of a republic, a military dictatorship, and a foreign protectorate.

But the clue to all that is now taking place in Bulgaria is that the PRINCE will not, and cannot, go away. He may affect to ask the Bulgarians whether they would like to keep him or to let him go; but he knows that in any case he has to fulfil his doom. He must stay, and therefore the Bulgarians must answer that they wish him to stay. Anything like freedom of election is quite incompatible with such a situation. Accordingly, the elections are being held after the approved fashion when princes ask for plébiscites. The polling is under direct military supervision, the ballot-boxes are in the hands of partisans, the returns are made as the returning officer thinks proper. Opponents who are too noisy in their opposition are seized and imprisoned. The Government manages the elections as it manages the elections in Spanish Republics, and as it has managed them in Spain itself, and used to manage them in France under the Empire. An appeal to the people always ends in favour of those who make it, for they have the means at their command of getting the result they wish. When it is remembered that a plébiscite showed that the Italians of Nice wished their territory to become French, it will be easily understood that plébiscites will show anything. It is very possible, too, that plébiscites, although they can have but one result, may really show the real feeling of the majority of the people. Nothing could have been more rigorous and oppressive than the interference of the Government when the plébiscites were taken by which the acts of LOUIS NAPOLEON were confirmed; but there can be no doubt that the mass of the peasantry at that time wished for the Empire. The PRINCE is confident that the vast majority of the Bulgarians care much more for him than for the Constitution, and there is nothing improbable in his assertion. Then the Russian officials who surround him take almost as leading a part in the election as he does, and the peasant who might hesitate to obey the wishes of a PRINCE is anxious to do what he thinks the great CZAR would wish him to do. Russia does not officially interfere in the matter. The Constitution was her contrivance, and she can hardly in decency proclaim its futility; and the Russian Government is too prudent to interfere openly in a matter the inevitable end of which is what she would desire. But the Russian officials in Bulgaria know that the PRINCE is not to be allowed to leave his Principality, and therefore they lend their countenance to all the steps which he is taking to make his stay there more satisfactory to him. There can be little doubt that he will have his way now, and then he will have an opportunity of showing what he can do for the land of his enforced adoption.

JEWIS IN RUSSIA.

THE representatives of the English Jews are not agreed as to the cause to which is to be attributed the persecution which their brethren have lately been undergoing in Russia. Serjeant SIMON, whose opinion we only know from the account given of it in Mr. GREEN's letter to the *Times*, appears to set down the sufferings of the Russian Jews to "their general rapacity, and to the crime of 'usury in particular.'" This, however, is only true of the poorer Jews, and even their sins are in part due to the neglect of their "richer brethren, who are selfishly 'heedless of the education of the masses.'" This is to us a wholly new view of the effect which attendance at school will have upon the poor. That education should encourage thrift and industry is intelligible, since it naturally quickens the scholar's sense of the value of money, and thrift and industry are obvious ways of making money. But why education should discourage usury is not equally clear. It would rather seem that, as lending on usury is an obvious and easy means of making a little money, more education should rather suggest usury than suppress it. The miserly boy who reaps a handsome profit out of his schoolfellows' necessities when

he knows their pocket-money to be exhausted is not an unfamiliar personage in stories of school life, but he is never either the idlest or the most stupid boy of the lot. If he despises the graces of language, he is at least quick at figures, and knows the value of being in the master's good books. Nor is it probable that the wickedness of taking interest for loans would be greatly insisted on in Jewish schools. Such teaching might seem to reflect upon names very eminent in the persuasion, and would have the additional disadvantage of setting the master at loggerheads with half the parents with whom he has to do. If Serjeant SIMON were to set up a school in Russia and try the experiment of giving the lessons which he wishes his co-religionists to lay to heart, he might soon find that the Jews were not above indulging in a little persecution on their own account.

Mr. GREEN traverses the SERJEANT's whole case. He denies that the Russian Jews are badly taught; on the contrary, they are much better taught than other Russians, and, indeed, than most Christians in other countries. The Jewish poor speak Russian Polish and an interesting language called Judeo-German. French is taught in their schools, though Mr. GREEN prudently does not say whether they speak it, and "they know Hebrew almost as a mother-tongue." Instead of their misfortunes being the result of want of education, it is their education that has helped to bring their misfortunes upon them. They are so exceptionally well taught that they fill rich Christians with jealousy and poor Christians with envy. It is sad, of course, that Christians should not be superior to these mean sentiments; but when Mr. GREEN tells us that Jewish education in Russia is so good that "it fits the 'poorest of my gifted race to compete with the most favoured classes, and to distance altogether the less cultured,'" it is impossible to feel any wonder that they are not. The vast majority of the Russian people are in a mental condition which it would be an extreme form of politeness to describe as "less cultured." Consequently the vast majority of the Russian people are "altogether 'distanced' by the poorest Jews." Mr. GREEN's explanation of the ill treatment suffered by his race is thus as nearly as possible the reverse of that given by Serjeant SIMON. Without attempting to decide an issue of fact upon which two such distinguished witnesses give conflicting testimony, we may say that Mr. GREEN's theory seems by far the more probable of the two. An unpopular race is almost always unpopular by reason of its virtues rather than of its vices. Vice, in the long run, seldom leads to wealth; and, whatever else may be uncertain, there seems to be no doubt that the Russian Jews are wealthy—at all events, wealthier than the Christians of the corresponding class. If the Jews would only get drunk and spend their money recklessly, there would be very little temptation to persecute them. It is when there are no pleasant vices which can be trusted to provide the correcting whip that the neighbourhood thinks it necessary to make good the want. The detailed exposition which Mr. GREEN gives of his brethren's merits fully confirms the argument drawn from analogy. The Russian Jews, he says, "are industrious, thrifty, sober, and intelligent." If it were possible that these virtues should co-exist with a total absence of any desire to succeed in life, their possessors might conceivably be popular. But the Russian Jews are not exceptionally deficient in this quality. They know how to make their virtues minister to their temporal prosperity. They deserve to get on and they do get on. They become, Mr. GREEN assures us—and we have no difficulty in believing him—"by sheer moral force of 'character the compeers of all, the masters of their employers, and the patrons of their would-be betters.'" If this is at all a true account of the Jews in Russia, the wonder is, not that they are persecuted, but that there is a single one of them left alive. They may be the salt of the commercial earth, but when their savour is so exceedingly pungent, the salt becomes as likely to be trodden under foot of men as if it had lost its savour altogether.

The two Jewish employments which Mr. GREEN singles out for special mention are the keeping of spirit shops and money-dealing. As regards the former, the Jews are completely and vexatiously proof against the temptation to be their own best customers. "They never get drunk nor 'become brutalized—sins of omission,'" as Mr. GREEN very justly says, "not forgiven by the peasant." It is easy to imagine in what light this unnatural moderation is regarded by those who are never able to leave a tavern sober. The

Jewish publican is believed to be continually on the watch for opportunities of adding to his customer's score without his customer's consent. He keeps sober, not because he dislikes getting drunk—that is an eccentricity inconceivable to a Russian peasant; not because he thinks drunkenness wrong—that is an affectation of morality which would be extraordinary in a Christian, and must be wholly unattainable by a Jew; but simply because, when the sober man makes out the bill of the drunken man, he can arrange the items to his taste. The point at which a man ceases to remember what liquor he has ordered is not necessarily the point at which he has ceased to order liquor, and however sceptical he may be of the amount charged to him, he has no means of disputing it. Mr. GREEN says that, of the three millions of Jews in Russia and Russian Poland, "a few are stated to be usurers." As he goes on to explain that they are "created by the necessities of the peasantry," since the peasant's "own kith and kin and creed will not lend them a rouble to save them from starvation," we will frankly say that we should be greatly astonished if many more than a few are not usurers. If it is followed with judgment, usury is a very profitable trade, and where a single race has from circumstances the monopoly of it, the demand for its exercise must be great. The fact that usury lends itself more than most legitimate industries to extortion and cruelty does not get rid of the fact that it is an industry without which a community cannot very well exist. The Russian Jews are not likely to be disciples of Mr. RUSKIN, and if they are not, they can hardly be blamed for remembering that, if their backs are to show a profit, bad security must mean high interest.

The one thing that does seem strange in the whole business is that the Russian Government has not interfered with greater decision to put down the persecution of its Jewish subjects. The virtues we have been dwelling on may be very irritating to the peasantry, but they are undoubtedly profitable to the country. It is the more incumbent, therefore, upon the authorities to take care that these unpopular virtues shall be guarded against the periodical attacks which they are certain to incur if their possessors are left to the protection of their own wits and their own hands. The Czar may possibly love the Jews no better than his subjects love them; but a man who has to receive taxes, instead of paying them, can hardly be ignorant that the wealth which is the head and front of a Jew's offending makes him as valuable to Russia as he is hateful to Russians.

A CHAPTER OF NEW ENGLAND HISTORY.

IT is sometimes imagined or assumed that a free profession of Protestantism in its extremest form, whatever may be thought of its theological merits or demerits, is at least a sure guarantee against the medieval horrors of superstition, bigotry, and intolerance. Those who so reason cannot indeed have very adequately mastered the first century of Protestant history and theology in Europe. But it is to another and more remote region that we would now direct their attention, partly under the guidance of a writer in the July number of *Good Words*, who in a paper on Sir Henry Vane gives some details of New England life which may stirle many even of those who have a general acquaintance with the early experiences of the Pilgrim Fathers. To ordinary English readers the name of Sir Henry Vane is probably most familiar as the hero and victim of that strange scene at the dissolution of the Long Parliament, when Cromwell marched two files of musketeers into the House, and, in reply to Sir Henry's indignant protest, "This is not honest, yea it is against morality and common honesty," as we are told, "fell a-singing, crying out with a loud voice, 'Oh, Sir Henry Vane, Sir Henry Vane, the Lord deliver me from Sir Henry Vane.'" They will remember, too, that the same vigour and independence of character, which made him resist the tyranny of the Protector in 1653, rendered him obnoxious twenty years later to the first Parliament of the Restoration, and led to his execution for high treason, though he had taken no part in the death of the King. He was then only fifty years old, but his public career began very early, and we are concerned with one of the first and least familiar chapters of his biography when he was seeking in the new world "to enjoy the blessing of a pure gospel," which, under the rule of Charles I. and Laud, he had found unattainable at home. He complained bitterly, we are told, that in England no clergyman would administer the Communion to him standing, which, however, he must have known was expressly forbidden by the Anglican Prayer-book. Some years before the colony of New England had been founded by a body of Puritan settlers, who received a Charter from the Crown, with power to elect their own magistrates, and who professed the

innocent and seemingly liberal design of "letting the Non-conformists, with the grace and leave of the King, make a peaceable secession, and enjoy the liberty and exercise of their own persuasions about the worship of the Lord Jesus Christ." They proceeded at once to establish a system, of which the leading features were a rejection of episcopacy, of the use of "Common Prayer," and Church ceremonies. Each congregation of worshippers was to form a separate and independent "Church," bound to other "Churches" by no ties but those of mutual charity, though for some reason they carefully eschewed the name of Independents, and at first—rather unintelligibly—declared that "they did not separate, and were not separate, from the Church of England." In October 1635 three notable strangers from England landed at Boston, Massachusetts, to join the New England colony, John Winthrop, afterwards Governor of Connecticut, who is called by Mather the "New English Nehemiah"; the notorious Hugh Peters, afterwards Chaplain to Cromwell, who preached in favour of the murder of Charles I.; and Sir Henry Vane, who within three months of his arrival was "admitted a member of the Church of Boston," and in the following spring was elected first a freeman of the Company of Massachusetts Bay and then Governor, being just twenty-four years old. He had already signalized himself, in conjunction with the Rev. Hugh Peters, by procuring a public admonition to Winthrop for his "over leniency in dealing with evil doers," which he humbly promised to amend by "taking a more strict course" for the future.

But more serious difficulties than this awaited the new Governor, which curiously illustrate the standard of religious sobriety and tolerance recognized among those who had rebelled against the milder yoke of the State religion in England. The first great question, which was indeed in train two years before Vane became Governor, is one that it is difficult for a modern reader to hear of without a smile, though at the time it threw the whole colony into a blaze and set every one by the ears. This was the great red flag question. In 1634 a certain zealot of the name of Eudicott tore the red cross out of the flag at Salem, and justified his act on the ground that "it was given to the King of England by the Pope as an ensign of victory, so a superstitious thing, and a relic of Antichrist." After mature deliberation on this knotty point it was resolved that the red cross should be expunged from all the flags except the one at Castle Island, but the exception somehow was ignored, and hence Thomas Miller, the mate of the *Hector*, an English ship in the harbour, complained to the new Governor that all the people of Massachusetts were traitors and rebels since the King's colours were not hoisted on the fort. Vane was very angry and Miller was forced to apologize, but it was not thought pleasant to have such stories carried back to England, and the Governor accordingly summoned the masters of the fifteen English vessels in harbour, and explained to them that unfortunately no royal flag could be found in the Colony; he probably omitted to give as the reason that they had all been purposely defaced. On this two of them offered to present a flag, which the Governor accepted, after first protesting that the settlers thought the cross on it idolatrous. And thus the red flag was at last hoisted in spite of the emphatic remonstrances of both magistrates and clergy. But when soon afterwards the Parliamentary Army in England also adopted this same idolatrous banner of St. George, the General Court of Massachusetts at once replaced it on all their ensigns "till the State of England shall alter the same, which we much desire." But their desire was not gratified, and in their exultation at the triumph of civil and religious liberty—as the Puritans understood the term—at home, they appear to have quite forgotten themselves, and the idolatrous emblem was thenceforth quietly retained.

The next dispute was not so easily settled, and in fact led eventually to Vane's return to England in the following year. The year before he landed at Boston there had come from England a certain Anne Hutchinson, "a woman (according to her admirers) of such admirable understanding and profitable and sober carriage that she won a powerful party in the country." But she used this power to "weaken the hands and hearts of the people towards the ministers," and denounced all fixed rules of faith or conduct on the plea of herself possessing "a new rule of practice by immediate revelation," though she disclaimed any miraculous aids. She moreover took to preaching, or at least to delivering public addresses to assemblies of women, criticizing the sermons preached on the previous Sunday, which the ministers, not unnaturally perhaps, did not quite appreciate, especially as she not only added instructions of her own containing some very queer, and not very intelligible heresies, but also gently stigmatized them as "Baal's priests, Popish factors, Scribes, Pharisees, and opposers of Christ," which they thought "very hard to bear." Governor Vane supported, while Deputy-Governor Winthrop vehemently opposed her, and in spite of the Court ordering a general fast to be kept, he informs us that "the difference in the said points of religion increased more and more." A denial of the personality of the Holy-Ghost and of heaven and hell appear to have been among the points mooted by Mrs. Hutchinson and her friends, but their grand offence consisted in their charging the ministers with teaching the deadly doctrine of "a covenant of works." As neither fasting nor argument availed anything, the civil and ecclesiastical authorities determined to adopt more efficacious remedies. For they had already decided—not very consistently with their original professions and protests—that "it is impious ignorance to say men ought to have liberty of conscience," whereas "religion admits of no

eccentric notions," and "for the security of the flock we pen up the wolf." Archbishop Leard and the Star Chamber—or the Spanish Inquisition, for that matter—could have said no more. Mr. John Grossmith, who had preached against three persons who were under a covenant of works, was fined 40*l.* and ordered to make public confession of his fault in every church. Mrs. Hutchinson herself and her brother-in-law, Mr. Wheelwright, being convicted of sedition and contempt, were excommunicated and banished. She went first to Rhode Island, and after her husband's death removed to Long Island, where she perished miserably in a massacre of colonists by the Indians, who were making reprisals for a treacherous slaughter of their own people by the Dutch settlers. The news of her death was welcomed with undisguised satisfaction at Massachusetts, where the Rev. Thomas Welder, who had taken a prominent part against her, after observing that it was doubtful whether the Indians had burnt her alive, proceeds to improve the occasion in the following moral and Christian strain:—

But alain it seems she is, according to all reports. I never heard that the Indians in those parts did ever before this commit the like outrage upon any family or families; and therefore God's hand is the more apparently seen herein, to pick out this woeful woman and make her, and those belonging to her, an unheard-of heavy example of their cruelty above all others.

Meanwhile the rival parties represented by Vane and Winthrop, who succeeded him as Governor, did not get on very comfortably together, and at last it was resolved to take more rigorous measures for the extirpation of heresy. Vane, who disapproved of persecution on all sides, wisely determined to return to England, but during the remainder of his life always used whatever influence he had at home for the benefit of the colonists of Massachusetts, who, under the rigid Puritan supremacy which followed on his departure, went on from bad to worse. He was himself shamefully persecuted by Cromwell, as a consistent opponent of every form of arbitrary government. In New England proscription, fine, banishment, and capital punishment became the order of the day for Anglicans, Quakers, Anabaptists, Adamites, and other such "unhappy sectaries and enigmatics." Not only did the "Blue Code"—so named apparently as seeming to be written in blood—strictly forbid "reading the Common Prayer, keeping Christmas Day or saints' days, making mince pies, or playing on any instrument except the drum, the trumpet, and the Jews' harp," which were supposed to have a kind of Biblical flavour about them; it also forbade mothers to kiss their babies on the Sabbath day, and enjoined that no one should run or walk in his garden, or elsewhere, except reverently to and from meeting. Readers of *The Scarlet Letter* will readily understand the moral results of this sort of legislation. As to religious toleration, "If," says one of their leading writers of that day, "after men continue in obstinate rebellion against the light, the civil magistrate shall still walk towards them in soft and gentle commiseration, his softness and gentleness is excessive large to foxes and wolves, but his bowels are miserably straitened and hardened against the poor sheep and lambs of Christ. Nor is it frustrating the end of Christ's coming, but a direct advancing it, to destroy the bodies of those wolves who seek to destroy the souls of those for whom Christ died." It is a curious satire on human weakness and inconsistency that the hideous system of persecution enjoined in New England by the very men who had fled, as they elegantly expressed it, from "those proud Anabaptists, the tyrannous bishops, and their proud and profane supporters and cruel defenders" under Charles I., was at last brought to an end after the Restoration by a peremptory order from Charles II. There are no crimes like those that are wrought in the name of liberty.

THE COMET.

THE appearance of a large comet in the northern heavens, though sudden, was not unexpected by astronomers. Telegrams from Cordoba, Brazil, and the Cape of Good Hope had warned them that a bright comet, first seen in the Southern Hemisphere on May 26, was wending its way northwards. The exact day when it would first show itself above the northern horizon was a little doubtful; but the substantial accuracy of the telegram announcing that it would be near the prominent star β Aurigæ on June 26 has been verified by the event. The publication of this prediction in the newspapers appears to have escaped the notice of the public; and thus the comet has been treated as one of those unexpected visitations which were formerly believed to portend wars, pestilences, and famines, and which are even now supposed to have some unexplained connexion with "phenomenal" weather. A glance at the present state of our knowledge with respect to comets may serve to dispel some of the illusions to which a certain class of the public still clings.

It has long been known that the mass or amount of ponderable matter, even in the largest comets, must be exceedingly small in comparison with the mass of any of the planets. But the possibility of a collision was sufficient to terrify the nervous; and it was not till the discovery of the intimate relationship, if not absolute identity, between a swarm of meteors and a comet that these fears were really shown to be groundless. We can only briefly refer to the steps by which this connexion was established between two classes of bodies differing so much in the aspect which they present to us.

In the year 1866 there occurred, on November 13, a very remarkable shower of meteors or shooting stars, and these exceptional displays were found to have recurred at intervals of 33½ years. It was shown by somewhat abstruse calculations, into which we cannot here enter, that if a meteor swarm revolved round the sun in an oval path in exactly 33½ years, the disturbing effect of the planets would be exactly such as had been observed. Hence it appeared that these meteors must perform their revolution in 33½ years, and it was then inferred that they must be moving in the same path as a comet observed in the year 1866, a few months before the display of shooting stars. Further evidence was supplied by the discovery that the path of the well-known August meteors was the same as that of the great comet of 1862, and that a shower of meteors annually observed in April followed the track of the great comet of 1861, through the tail of which the earth is believed to have passed. But it was in 1872 that the most interesting facts in connexion with the relation between comets and meteors were brought to light. Towards the end of 1872 astronomers were eagerly expecting Biela's periodical comet, which had excited their attention in 1846 by its splitting up into two distinct bodies; but it was sought in vain. In its place, however, appeared, at the end of November, a striking display of meteors, and subsequently, on the 2nd and 3rd of December, a comet was observed in the track which the meteor-stream might be supposed to have taken. It has been inferred, with some show of reason, that the earth actually passed through one of the heads of Biela's comet on November 27, 1872, and that the only effect was a shower of shooting stars. At a little distance the meteor-swarm would seem to have presented the ordinary appearance of a comet. The chain of circumstantial evidence which connects comets and meteors is still further strengthened by the examination of their spectra. By the help of the spectroscope it is found that the light of comets is derived to a great extent from glowing vapour of carbon in some form or other, and it has also been shown that meteoric stones which have fallen on the earth give off, when heated in a vacuum, vapours producing the same spectra as those observed in comets.

It would seem probable that the nucleus of a comet is neither a solid nor a gaseous body, but a mere cluster of discrete meteoric particles through which the earth might pass without experiencing any effect beyond that of a startling shower of shooting stars, and that the head is composed of gases evolved from these meteors under the combined action of the sun's heat and the rarefaction of space. With regard to the formation of the tails the most plausible theory appears to be that they are due to a repulsive force, emanating from the sun (possibly electrical), which acts on the gases evolved from the nucleus, and generates tails in different directions according to the molecular constitution of the gases.

Having thus briefly sketched the general history of comets, we may refer to one or two points connected with the present comet. The first point that calls for remark is the circumstance that this comet is moving along the same track (approximately) as that of the comet of 1867. Now, it is to be remembered that the great comet which was seen last year in the Southern Hemisphere was found to be travelling in the same path as that of the comet of 1843. In both cases it appears difficult to account for the return of the comet within such a short time. And if the comet had regularly reappeared at short intervals, it ought to have been seen at former apparitions of which there appears to be no record. The conclusion seems to be thus forced on us that there may be two or more comets travelling in the same track. This would quite accord with what we know of meteor-streams, there being decided evidence of aggregations of these particles at different parts of their orbit.

Another important matter is the application of photography to the invisible portion of the spectrum of this comet. Mr. Huggins has succeeded in obtaining a photograph showing two bright lines in the ultra-violet region, which appear to belong to the spectrum of the vapour of carbon (in some form). At Greenwich Observatory bands were observed in the green, the blue, and the violet corresponding to bands in the spectrum given by carbon in the blue part of the flame of a candle. It has hitherto been somewhat doubtful whether the comet-bands indicated carbon in this form or in that exhibited by a vacuum-tube containing a carbon compound in a highly rarefied state. In this connexion it may be mentioned that Professor H. Draper of New York has obtained a photograph of the comet, though he has not yet succeeded in photographing its spectrum as Mr. Huggins has done.

With regard to the physical appearance of the comet, it may be mentioned that by July 3 the light will have diminished to one-third and by July 16 to one-tenth of the brightness, when the comet first appeared on June 22. Such calculations, however, are necessarily subject to some uncertainty, as we are still imperfectly acquainted with the causes which determine the brightness of comets. The northward motion of the comet also has a great effect on its visibility in raising it above the mists of the horizon and in clearing it from the effect of twilight. Under these circumstances we may expect this comet to remain a conspicuous object to the naked eye for some little time to come. In the telescope it is likely to prove even a more interesting object than the comet of 1874.

THE BALCOMBE TRAGEDY.

IT is natural enough that the circumstances of the murder which took place on the Brighton line at the beginning of this week should have suggested to the industrious journalist the famous Briggs-Müller transaction at Old Ford. That murder is famous not merely in history but in literature. For Mr. Matthew Arnold, as all men know, endeavoured to prove, not merely by written but by spoken words, to the British Philistine that it was well that things should be so. The British Philistine did not see it; but it is the prerogative of the British Philistine not to see it. Now, the tunnels of the Brighton Railway have acquired a historic celebrity not inferior to that once possessed by the very unromantic piece of line which passes the place where matches which "strike only on the box" are made. The *Newcomers* had already assured these tunnels their place in literary memory; it is only to be regretted that a real and not a fictitious drama should give them additional celebrity. They (or one of them) have demonstrated, or helped to demonstrate, yet once more (we wish it could be for the last time), the almost inconceivable stupidity of the English police. There is probably not another country in the civilized world where such a thing as happened on this occasion could have happened. There was a time when we had, properly speaking, no police. We had political spies paid *ad hoc*; we had thieftakers whose morality was doubtful, but who managed when it pleased them to take thieves. But it was borne in upon us that we ought to have a police, and a police we have with a vengeance. "Do not adopt our institutions *à demi*, my friend," said the Prince Montecour. That is exactly what we have done. We have several Commissioners of Police, an elaborate county and borough force, a Director of Criminal Investigation, and everything handsome about us. But the two chief functions of a regularly constituted *agence des mœurs*—the suppression of scandals which may affect the innocent, and the detection of crimes which can only concern the guilty—we have not, at any rate, in a state of performance. A short time ago a trumpery and obviously impossible case of alleged fraud on a Co-operative Society was brought before a magistrate, and was reported in full, with the name of the victim. Our *agents provocateurs* are instant in the fabrication of affecting stories whereby to tempt unhappy chemists to supply deleterious drugs for the relief of too-confiding damsels, in inducing casual tobaccoists to book 10 to 1 bar one on suburban races, in prevailing on good-natured publicans to supply half-a-pint of beer to thirsty souls five minutes before or five minutes after the sacred hours prescribed by an all-wise Legislature. But when a real and terrible crime presents itself they are, like the American carter, "not equal to the occasion." They reverse the lesson often taught in childhood; they can make a stone, but can by no means break one. It is easy to manufacture a crime; hard and troublesome to detect one. And yet anything more simple than the circumstances of this murder on the Brighton Railway it is absolutely impossible to conceive.

We take the facts as they are reported, with insignificant differences, by a large number of independent authorities; and we may observe that the recapture of the man Lefroy, or even his demonstrative innocence, does not affect that part of the question which is really important to the public in the very least. On Monday last, when the afternoon Brighton express reached Preston, the outlying station for Brighton where tickets are taken, a person was noticed either in, or leaning out of, a first-class compartment in a condition of much dilapidation. The carriage itself was in a still more suspicious state, being covered with blood. The dilapidated person gave himself out as a journalist, by name Arthur Lefroy, and by domicile an inhabitant of Wallington, a suburb of Croydon. He proceeded to what on the face of it must be described, in the language of fiction, as "a story of a cock and of a bull, and of an elderly gentleman and of a countryman, and of a pistol shot." We need not recite this story, which everybody has by this time read. The suspicions of the police were, we are told, aroused, but they were aroused in a most astoundingly inefficient fashion. While they assigned the doctor, whom he demanded, to the wounded person, they had ample time to find out whether that wounded person's story of a business errand to Brighton was true, whether any trace of the elderly gentleman and the countryman was to be found on the line, whether the nature of the interesting victim's wounds corresponded to the account he gave of the audacious countryman's maleficence. All this could have been done very speedily, very effectively, and without exciting the least scandal as to Mr. Arthur Lefroy's precious reputation. We dismiss the story of a watch and chain having been found in Mr. Lefroy's boot as incredible, for even a British policeman knows that watch-pockets in that portion of the attire of a gentleman have not yet been introduced. The one glimmering of reason which the conduct of the police displayed only serves to illuminate their darkness still further. They submitted with a childlike docility to Mr. Lefroy's demand to be taken home without doing his errand in Brighton. They did not ask the surgeon as to the nature of his wounds or impertinently discuss the presence of a coin known as a "Hanover medal" in some numbers in his pocket. They could not bring themselves to wait for the result of the idle formality of a search along the line. But they did send a detective with him to his home. This promising member of the profession of M. Claude, according to one account, "left his companion and returned a little later." According to another, he allowed him to change his clothes, but did not observe the precautions of Mr. Samuel Weller on a much

less momentous occasion. The result might, one would think, have been predicted by a tolerably intelligent child of the age of five years or thereabouts. The policeman inquired of the persons of the house, "Ubi est ille Toad-in-the-Hole?" and he received the traditional answer, "Et responsum ab omnibus, 'non est inventus.'" The Feast of the Invention of Mr. Lefroy ought to be a green-letter one in the police calendar. It need scarcely be said that we do not assume the guilt of this polyonymous journalist and dramatic author. It need scarcely be said, also, that we do not vouch for the correctness of the facts as reported. There may be no murder in the case. The unfortunate Mr. Gold may have overbalanced himself and dropped out of the window. The countryman may be a real countryman, and may, not content with shooting Mr. Lefroy, have subsequently scratched him, torn off his collar, and generally maltreated him out of pure exuberance of conscious and maleficent power. The police may not have had half the facts to go upon which industrious *reportage* has amassed for the benefit of newspaper readers. But when the amplest allowance has been made for these possibilities, the conduct of the Brighton police remains utterly inexplicable. Had they feared to cast inevitable suspicion on a possibly innocent man, their feelings would have been at least respectable. But, as has been sufficiently pointed out, no such suspicion need have been cast. A certain period of rest and medical care was most reasonable to prescribe to the victim, according to his own statement of a murderous outrage. During this period every material inquiry might have been completed. The authorities may, indeed, urge that they could not anticipate the imbecility of their delegate. But it has got to be shown, first, whether the orders given to that delegate were such as to guard against any mishap, and, secondly, what was the reason for running the risk which the police ran. An innocent man in Lefroy's position could have no motion for evasion, which could only give him trouble in the long run. A guilty man should have been allowed no chance of attempting it.

With a wonderful, if not altogether intelligent, unanimity the newspapers have been recommending, as they recommended nearly twenty years ago, the adoption of the American system of no compartments and continuous carriages. This is a point on which it is somewhat superfluous to offer advice. The general public will, no doubt, finally express its opinion, and that opinion will be followed with the decent reluctance which Railway Companies always show. The advantages of the two systems can be very easily contrasted. Pullman cars have now run for some years on English lines (including the very one on which this disaster happened), and public saloon carriages on many others. The Pullman or the saloon does not, it may be remarked, offer a complete security against such proceedings as those of Müller and the "countryman," though that security is very considerably increased. Only the genuine and complete gangway system, with no difference of classes, could altogether allay the fears of the timid, which will certainly not be lessened by Mr. Chamberlain's light-hearted answer to Mr. Sheridan on Thursday night. Now there are not many murderers, and there are a very great many objectionable companions. "Take my life, but spare my collar," said the traditional dandy to the highwayman. According to Mr. Lefroy's story, the malefactor in this case was equally hostile to life and to collars. But ferocity of this kind is rare; and, as a rule, the traveller would have to choose between a possibility of being very unpleasantly murdered and a practical certainty of draughts, neighbourhood of persons whose command of the minor refinements of manner is limited, and an infinitely increased danger of the abominable nuisance of forced conversation, unless he is prepared to show his distaste for that amusement in a decided and churlish manner. It is for English taste to decide which is best worth having, the probability of privacy and the possibility of meditation, or the freedom from the off-chance of murderous or criminal assault. The rapid improvement of the tricycle perhaps offers an alternative to those finical persons who, not being able to afford post horses, would rather travel with a murderer than with one who insists on talking without h's on a subject he knows nothing about. But, without prejudicing the new demand for a further Americanization of our institutions, it may be pointed out that the danger of things as they are may be immensely modified "with brains." Ropes and electric bells are capital things, though they are suitable rather for accidents than for crimes. But the difficulties and dangers in the way of a railway criminal would be enormous if they were not smoothed away by contributory idiocy on the part of the guardians of the public safety. The possibility of getting rid of a body from a carriage could be avoided by a very simple system of checking the inmates of compartments on long-distance journeys. The possibility of escaping from a train in motion involves so great a risk that few criminals are likely to chance it. In any case of suspicious appearance at the terminus or any station, the police and officials have the game in their own hands. It is, of course, possible to throw that game or any game away, and unless gross injustice has been done to the authorities in this instance, it is a case in point. But against such superhuman stupidity as that of which we are asked to believe that the Brighton officials were guilty, gods and men are alike powerless. All the saloon carriages, all the guards, all the electric bells, all the through-train gangways and outside platforms in the world, will not guarantee us against that.

LITERATURE AT THE MANSION HOUSE.

THE "Representatives of Literature" met at the Mansion House last Saturday evening to receive the hospitality of my Lord Mayor. They mustered three hundred strong; they included poets, preachers, novelists, dramatists, journalists, and publishers, not to speak of noble lords, Indian princes, City sheriffs, aldermen, deputies, and ambassadors. It might at first sight appear difficult to get together so many men of genius at one table, but literature is fortunately a word which covers a wide area; every one, for instance, who contributes to a paper, even in the advertising or the paste and scissors department, may consider himself a representative of literature. We should, it is true, be inclined to draw the line above the office boy; but it cannot be denied that he, too, has much to do with the production of his journal. The difficulty is not, it would seem from the published list of the guests who presented themselves, so much to fill the tables as to persuade the men who, by common consent, stand in the front rank of literature to accept the invitations sent to them. Of course we confidently assume that invitations are always sent to those illustrious writers, who on this, as on previous occasions, have been conspicuously absent. For example, the names of Messrs. Tennyson, Browning, Swinburne, and Morris would occur to an outsider as the most truly representative of living English poets; but these authors having been unfortunately unable to attend, one cannot feel that their loss was altogether supplied even by Lord Lytton and Mr. W. M. Rossetti. Again, every one was glad to see the author of *Lorna Doone* in a place of honour; but one would have liked also to see those veteran novelists, Mr. Anthony Trollope, Mr. Wilkie Collins, and Mr. George Meredith, who, we are obliged to suppose, had engagements elsewhere. Of scholars there seemed hardly any; yet surely at the end of Term the great scholars of Oxford and Cambridge, to say nothing of those in London, one might think, would have been free to accept the bidding of his Lordship. Nor do we think that Mr. Justin McCarthy was altogether adequate to represent single-handed the department of history, in which we missed certain writers, perhaps more solid, if not so brilliant, as, for instance, Mr. Freeman, Mr. Froude, Mr. J. R. Green, Professor Seeley, Mr. Lecky, Mr. John Morley, and Mr. Leslie Stephen. It was really unfortunate for the dinner that all these writers, the "representatives" of so many departments, were previously engaged. Could they, one wonders, have been having a little literary dinner at Greenwich all by themselves, with the press excluded? But if the leading men in the "higher walks" were mostly absent, the department of journalism was most fully and thoroughly represented. Everybody seemed to be invited; those who were privileged to know the great men by sight could point out London correspondents by the dozen; there were those who are suspected of "doing" the reviews; those who, it is darkly rumoured, write leading articles; even those who cut out the funny stories from American papers. As regards the list of journalists who should be invited, it had evidently been drawn up in a most friendly and comprehensive spirit, so as to avoid the creation of jealousies, and to remove any opportunity for indulging in the hateful spirit of envy. We would not wish to exclude one of these writers; the genius of a Shakespeare may lie, dormant as yet, in every one; yet, we repeat, we cannot but regret that so many, so very many, of the men known outside Fleet Street were unable to accept the invitations which, we are sure, were sent to them. And it was, doubtless, through the fear of wearying his guests that the host forbore to speak of his many disappointments.

A dinner at the Mansion House, especially for those who assist at it for the first time, is an imposing and magnificent spectacle. It is pleasant to march into the Egyptian Hall past a row of fiddlers dressed in red, who scrape with enormous zeal, and somehow remind one of King Cole's Three Fiddlers, according to the rendering of Mr. Crane; it is pleasant to sit opposite to a person who is going to make a speech after dinner, to mark his intervals of reflective silence, and, as his turn approaches, the contortions of his countenance; it is pleasant to have an excellent band discoursing throughout the banquet; it is delightful, if one is so placed as to be able to see these glories, to let the eye rest upon the Lord Mayor's Trumpeter in green and gold, with his hat on, as becomes a Trumpeter. He stands behind the chair, and does not disdain occasionally to hand a plate. But why does he not blow the trumpet, which ought to be in his hand? Surely the City Trumpeter was your first City toast-master; and the original Harker, instead of calling "Sit—lence, gentlemen, for the Right Honourable the Lord Mayor!" blew a melodious blast which hushed the revellers and recalled them to the serious business of the banquet. Then one may behold the gold mace. Lastly, one may gaze upon the Lord Mayor himself, and reflect upon the transitory nature of all human glories, and especially of this civic presidency.

The speeches which followed the dinner of last Saturday were remarkable, with one or two exceptions, for their surprising badness. Now, at a dinner of representatives of literature one expects something out of the common; the very presence of so much genius should give rise to a spirit of emulation among the speakers; before the assembled poets, novelists, dramatists, journalists, philosophers, historians, and reporters of England, one might expect, if not bursts of florid oratory, yet graceful speeches, epigrammatic utterances, and things which might be remembered. It is true that the themes are threadbare; but what is the use of

genius unless it can adorn even a threadbare topic with flowers of fancy? The greatest artists do not disdain the commonest objects. The usual loyal toasts were given and received with the usual enthusiasm; they were followed by the patriotic toasts responded to by one gallant officer who seemed, like Balbus, ready to think, though it would not do to say so, that it was all over with the army, and another who permitted himself only to praise our soldiers' goodness of temper. Then there were toasts to the Houses of Lords and Commons. After this came the real business of the evening, which was opened by the reading of a telegram from Berlin. In this document the Chairman of the *Concordia* said he loved the British nation for having produced Shakespeare, and invoked the protection of Heaven upon the Lord Mayor. Here some of the frivolous laughed, and were rebuked by the toastmaster. The Lord Mayor then proposed the health of his guests, and divided Literature, for oratorical purposes, into Poetry, Fiction, History, Classical Literature, and Journalism, calling upon various people present to respond. Now, if there were one thing which a literary craftsman should understand, one would think it would be the manner in which a speech, like a leading article, should be turned. It must be within certain limits, not greatly in defect or in excess; it must have in it a few distinct points; it should turn upon one leading thought, treated freshly, even if it be a commonplace; it should be bright; it should, in fact, please. All the "representative" speakers had received due notice—rumour said a fortnight's notice—yet, with one or two exceptions, upon which we will immediately remark, not one had come prepared with a speech at all worthy the occasion. Lord Houghton, of course, was one of these exceptions. His speech was cheery, short, epigrammatic. He understands how to say good things, and to say them in the happiest manner. Unfortunately, Lord Lytton, who followed him, seemed to think that a poet, like the brook, was entitled to go on for ever, in an even current, undisturbed by any sparkles or wavelets of wit or epigram. No one, again, can object to Mr. Blackmore and Mr. Black being called upon to respond for fiction; but we were truly disappointed when Mr. Blackmore mournfully confessed that he had nothing at all to say, and when Mr. Black could find very little more to say than that he was once, while in America, taken for Mr. Blackmore. Why cannot Englishmen speak on such occasions? A Frenchman would have found for such a toast a thousand pleasant compliments for his host and his fellow-guests; an American would have replied with fluency and dignity; an Irishman with ease. And if these two writers had been set down to a table with paper and pen and told to write a speech in reply, they would have written a short chapter of thanks, without premeditation, in good style and nervous English. As there seemed to be no other scholar present, Dr. William Smith responded alone for "Classical Literature." This was very much as if the shepherd should respond for the sheep. Lord Sherbrooke and Mr. Edmund Yates, who spoke, and "spoke up" for Journalism, were, with Lord Houghton, the pleasant exceptions. Lord Sherbrooke was incisive, ironical, and slightly contemptuous; Mr. Yates was short, bright, and clever. By some remarkable accident, the Drama was omitted altogether, yet all the dramatists—they are few indeed—were present, and most of the dramatic critics. Then the dinner came to an end, and the guests came away. The moral of the story is that, although a good many clever men were got together, the scholars, historians, and philosophers who make up the serious literature of the period were all absent; most of the leaders in every literary department were also absent; one department was overwhelmingly represented; and it was proved to everybody's satisfaction that the art of after-dinner speaking is one little studied and rarely acquired.

THE UNIVERSITY MATCH.

THE result of the University Match was accepted by the friends of Oxford much as the result of the general election was welcomed by most Liberals, in a temper of devout thankfulness and scarcely suppressed amazement. Cambridge looked invincibly strong on paper, and Mr. Steel, like Mr. Kinglake's dragoman in *Eothen*, "struck terror and inspired respect." Cricketers knew, though the cricket reporters of some newspapers did not, that it was absurd to say that Mr. Steel's right hand had lost its cunning. The analysis of the performances of University bowlers shows that he has got 48 wickets in this season to Mr. Evans's 28 and Mr. O. T. Studd's 31. He has been more expensive than usual, but that is because the year has been warm and dry, and the grounds true and lively. His bowling in the University match, though less successful than of old, was as remarkable as ever for variety of pitch, pace, curve, and work. That this would be so was well understood beforehand, and it was still more disagreeable for Oxford men to reflect on the batting strength of Cambridge. Cambridge could afford to discard a meritorious old Blue, just as Mr. O. U. Lane was once left out of the Oxford Eleven. Is it not written in the book of the Chronicles of Lillywhite? Cambridge even felt strong enough to dispense with the services of a bat like Mr. Miller, while illness deprived Oxford of two good bats and a slow change bowler. Though the trial match with M.C.C. at Lord's was tolerably satisfactory, the performance of Oxford against Middlesex had shown that their bowling might be loose and that second-rate opponents might get their wickets. All that the

most hopeful could say was that, "if Evans was on his day, and Leslie came off, Oxford had a chance." Mr. Evans was "on his day"—his three days rather—and Mr. Leslie did "come off."

When Monday appeared, in a blanket of mist and soft rain, things looked worse than ever for the Dark Blue colours. It seemed just the sort of day that Mr. Steel likes; fishing, rather than cricket, weather; a slippery wicket, and a bad light. Oxford had a piece of luck (they were lucky all through) in winning the toss. For the three years of Cambridge victories "tails" had always been the successful choice. Should a judicious captain follow the run, and call "tails" again, or trust to the reappearance of "heads"? This is one of the questions on which the greatest minds have ever been divided. We are for backing the *série*. Mr. Bligh was otherwise minded. He called "heads," but "tails" were still in the ascendant, and Oxford went in on the fresh wicket. Mr. Patterson and Mr. Trevor opened the batting, while the early bowling was entrusted to Mr. Steel, Mr. Ford, and Mr. Wilson. The two latter bowlers are fast medium and fast; neither of them was very successful. Mr. Patterson showed great steadiness, and Mr. Trevor played, as usual, in the most attractive and manly style. In spite of good fielding, they ran the score up to about 50, when Mr. Trevor retired from the wicket, apparently either caught by wicket-keeper or "leg-before." It seems that he had anticipated the umpire's decree, for he was given "not out" and walked back again. But here the luck was broken. Mr. C. T. Studd began to bowl from the Nursery end, and Mr. Trevor was caught at the wicket for what proved to be a longer innings than any Cambridge man attained, an excellent 41. Disaster followed disaster. The two slow bowlers seemed quite unplayable, as their deliveries twisted very variously, and the balls on the off rose up sharply and almost perpendicular. The Oxford batters could not leave these off balls alone. Mr. Patterson gave Mr. Ford, at short slip, the first of four catches which he secured in the innings. Mr. Leslie, playing unlike himself, ran in to a ball of Mr. Steel's and slipped in trying to regain his ground. Many of the lookers-on, of both parties, were of opinion that he did recover himself in time, but the umpire gave his decision for Mr. Hone, the wicket-keeper. This should be set against the decision (not, we think, mistaken) which saved Mr. Leslie in the second innings. He only made 4 runs; and one of the panics which have so often ruined the cause of an Eleven followed his fall. The bowlers puzzled and beat the batsmen at least twice in every over. Mr. Evans prevented his rival short-slip with a catch. Mr. Thornton was not less generous. Mr. Bligh, extending himself in a miraculous way like a telescope, caught Mr. Peake at point. This is as good a place as any other for saying that Mr. Bligh's fielding throughout was worth a visit to Lord's to see. He stopped the most impossible-looking cuts with perfect grace and ease, returning the ball in the same action. Six wickets fell after the score was at 58, and only 18 runs were added to the account of Oxford. Mr. Whiting managed to amass 9, and fell immediately after luncheon, which festival was favoured by half an hour of dry weather. Then Mr. Kemp and Mr. McLachlan got together. Neither of these players seems to have any "nerves"; both batted with the utmost pluck, like men "incapable of their own distress," and they hit up 50 runs by fine driving and cutting. Mr. McLachlan was caught off a good drive from Mr. Ford; Mr. Harrison, the slow bowler, was run out, partly, we fancy, from a moment's inattention; and Mr. Robinson played "a regular bowler's innings," leaving Mr. Kemp not out with a spirited 29. The score was 131. The throwing in of Cambridge was particularly accurate, the wicket being repeatedly thrown down; and the running of Oxford between wickets was not very decided or judicious. The bowling of Mr. Studd and Mr. Steel had deserved and commanded success.

In a bad light, and on a wicket so wet that the bowlers slipped and made much use of sawdust, Mr. G. B. Studd and Mr. Bligh faced Mr. Evans and Mr. Harrison. Mr. Evans's first ball, which rose very swiftly, about mid-wicket high, scattered Mr. Studd's stumps and bails as if a small charge of dynamite had been exploded under them. Mr. C. T. Studd and Mr. Bligh then played almost the best cricket of the match. The former hit with such force that the ball scarcely left his bat before it reached the ropes. Mr. Leslie saved many fours at long leg, and often received the meed of a melodious cheer. Mr. Robinson (left hand), and Mr. Peake (fast with a very high delivery), were tried in vain. Mr. Thornton, sometimes so deadly, bowled a very lucrative over, and obviously could not find firm ground for his feet. Mr. Evans was bowling very fast and straight, and his balls rose dangerously. About sixty-five runs were on for one wicket, when the sky became ominously light, the rain from the south fell heavier than ever, and play was stopped. This was Oxford's chief piece of luck. The batters were interrupted just when well set. The rain lasted for more than an hour, and the populace kept howling "play." As usually happens nowadays, popular agitation prevailed, and the men went out at twenty minutes past six in a funeral light. Mr. McLachlan bowled from the Nursery end, with the utmost accuracy. His object was to keep down the runs, and maiden over after maiden over was applauded. Now, too, it became manifest that the "day" of Mr. Evans had dawned. He bowled Mr. Bligh for an excellent 37. He hit Mr. C. T. Studd on the arm, and struck the top of his middle stump with the next ball. He gently removed Mr. Steel's leg-bail. Time was now up, and four good wickets down for 81 runs. Tuesday brought excellent light and a sound wicket, but Mr.

Evans was not to be denied. He caught Mr. J. E. K. Studd, and bowled Mr. Wilson. Mr. Ford, as always, played a sound innings, and, aided by Mr. Whitfield, took the score above that of Oxford. But Mr. Evans scattered his bails, and bowled Mr. Whitfield. Mr. Rowe, a left-handed bat, gave some trouble, and Mr. Spencer was just beginning to hit, and to delight the ring, when Mr. Robinson jumped up, and caught in his left hand a ball that, next moment, would have reached the ropes. This was the catch of the match. Mr. Harrison's patient merit was rewarded by a shooter that beat Mr. Rowe, and the Cambridge innings ended with 48 runs to the good.

The performances of Mr. Trevor and Mr. Patterson, in the second innings, seemed a repetition of the events of Monday. But this time they passed the fatal 58, and it was not till after luncheon that a fine ball of Mr. C. T. Studd's bowled Mr. Trevor for another beautifully hit 40. He thus secured the second best, and certainly the prettiest, score of the match. Mr. Leslie again seemed a little unhappy at first. He played a ball back to Mr. Ford, when he had made 9, and left his wicket. To ourselves there seemed no doubt at all that the ball touched the ground after leaving his bat. This was a common opinion, and cries of "ask it" came from the Pavilion. Mr. Patterson "asked it," and Mr. Leslie stood forlorn, like Eurydice when Orpheus looked back at her, on the debatable land between the Pavilion and the wicket. After a pause he returned, the decision being in his favour, and he began to score in earnest. Every possible change of bowling was tried, except that the Cambridge captain did not bowl slow underhand, which all captains of all ages have done in straits like these. Mr. Patterson's finger was split open by a ball from Mr. Wilson, and he retired to have it sown up. This accident did not abate his success. Mr. Whitfield was tried, and Mr. Steel and Mr. Studd kept changing ends. At last, when Mr. J. E. K. Studd was put on (the score being about 180 for one wicket), Mr. Leslie failed to get hold of a leg ball, skied it, and was caught by Mr. Rowe. He had made 70 in his usual style of defence, so sure that it seems almost contemptuous, and of determined hitting. A fine drive for 5 to the most open part of the ground was his largest hit. Now came Mr. C. T. Studd's opportunity. Bowling as well as ever, he proved fatal to Mr. Thornton, Mr. Evans, Mr. Kemp, and Mr. McLachlan. These two "glittering Diogenes" of the first innings failed to score. Mr. Peake, however, amassed 24, and there were some fine hits in Mr. Whiting's 22. Meanwhile Mr. Patterson's steady attention to business was rewarded by 100 runs, and when the Oxford change bowlers had fallen at seven o'clock, he carried out his bat (having gone in first) for a faultless 107.

Neater bats, or neater to our mind,
May drive or cut, more sure we shall not find.

to parody Mr. Swinburne. Through the whole long innings of 307 the Cambridge fielding had never slackened, save when Mr. Leslie might have been run out, nor had the bowling become loose.

Wednesday seemed a perfect day for run-getting, and we scarcely think it was 6 to 4 against Cambridge, who had to acquire 259 runs. The Oxford bowling, except that of Mr. Evans, was not absolutely first-rate. But the captain was intent on victory. Mr. Bligh was caught off him (a most difficult catch, run for by Mr. Trevor), and Mr. G. B. Studd was well taken at wicket by Mr. Kemp off Mr. Harrison for 11. Mr. C. T. Studd and Mr. Steel now got together, and for a while looked like repeating the performance of Mr. Leslie and Mr. Patterson. Mr. Steel had been driving with wonderful vigour when Mr. Evans caught him at slip. Mr. Studd was immediately caught in a very unlucky way; Mr. Whitfield only got a single; and, if Mr. Ford and Mr. J. E. K. Studd (both of whom have this year got a hundred in an innings) failed, it was all over with Cambridge. One of Mr. Peake's fast balls (he was now bowling very well) beat Mr. Studd; and, after luncheon, a rout followed. Mr. Evans secured the last two wickets in two consecutive balls (it was good judgment to send a sure catch, Mr. Heale, fielding for Mr. Patterson, to the limit of the ground to lie in wait for the hard-hitting Mr. Spencer), and the innings ended for 123. Out of twenty wickets, Mr. Evans bowled, or caught, or had caught off him, sixteen, a feat that rivals the great exploit of Mr. Butler. No one ever worked harder for success. On the whole, the fielding was good throughout. Long-leg at the southern end made one or two slips on both sides, and there was some weakness at mid-off in the second innings of Cambridge. Mr. Kemp's wicket-keeping was often brilliant. Could the match be played again, the chances would be almost even.

THE THAMES IN MIDSUMMER.

THE English climate leaves much to desire, and it might be an advantage if the Metropolis consumed more of its smoke; but Londoners, at all events, are fortunate in their river. If we desired to give a foreign friend an idea of the pleasures and humours of English holiday life, we should take him a trip up the Thames above town in what ought to be our finest season. Henley week should be as good as any for the purpose, always supposing the weather to be favourable. It is towards the end of June that the meadows and the wild bits of common, the sloping lawns and gardens and the hanging woods, are dressed out in their freshest green and wearing their richest foliage. The bottom of

the Thames Valley in the depth of the winter must be the very abomination of damp and desolation, and we pity the occupants of low-lying tenements who are bound to inhabit them all the year round. The turbid stream overflows its banks, turning flower-bedded meads into dismal swamps and breaking back into stretches of stagnant water. Dense fogs envelop the shivering landscape; the turf in the gardens becomes sodden as sponge; a fine growth of mosses and unwholesome fungus is fostered on the slates and the roofs of the verandahs; and windows must be kept hermetically sealed against air that is laden with the pungent rawness of earth-odours. We always imagine that prudent residents in those circumstances, with the terror of the doctor and undertaker before their eyes, must fall into the fashions of amphibious Dutchmen; betake themselves to systematic smoking and spirit-drinking; lay down pipes of sound old port in their half-submerged cellars and order quinine powders from the chemist by the gross as articles of regular family consumption. But with the glowing lights of a beautiful summer, when the Londoner is tempted out for boating and water parties, everything is changed, as it were, by enchantment. The wet that has been soaking in through the last six months is vivifying nature under the power of the sunshine. Can anything, for example, be more delightful than the delicate shades of colour in the garden of that singularly picturesque cottage? There is a faint flush of scarlet over the geraniums that have only lately been bedded out for the season. The standard roses are breaking into crimson bloom, and the "Gloires de Dijon" on the cottage-walls are showing like so many strawberry-tinged snowballs. The rhododendron and azalea blossoms have begun to pass away; but the clumps are covered like the hedges of laurel with strong young shoots of the tenderest green, and the climbers and creepers that drape the verandah are already interlacing themselves in networks of tendrils. The swallows that go flashing and dipping over the stream have been busy building everywhere under the eaves and gables, and the call of the cuckoo is still occasionally to be heard; nor are the nightingales and our native songsters as yet silenced in the shrubberies. We own to a predilection for nature unadorned, nor do we greatly care for the brilliant formalities of Cockney gardening. Yet we must acknowledge that a "warm man" might do worse than retreat from the sorrows and excitements of City life to the staidier mansion that rises round the corner. It stands, in the language of fashionable house-agents, "in its own well-timbered grounds," and looks down upon the river over its terraced lawns. When the sun is waxing warm, and any sort of shade would be welcome, there is something refreshingly luxurious in the sight of these variegated sunblinds contrasting with the gleam of the stuccoed balustrades; while the rippling sounds of music and laughter stealing softly down to us through the open windows are pleasantly suggestive of merry luncheons, with siestas, flirtations, or lawn tennis to follow, according to the ages and tastes of the guests. With the striped pavilion pitched upon the lawn on one side, the roomy boat-house in the creek under cover of the willows, it seems the very place where people "in society" might give garden parties, and be sure that their friends from the Park and Piccadilly will be only too glad to put in an appearance.

But ninety-nine Englishmen in a hundred naturally detest the notion of frockcoats in association with the Thames, and most of the younger and more active generation prefer the looser of flannels to any other wear. There is nothing pleasanter than a voyage in a steady pair-oar, with stowage for a small bag or two under the seats, when the party can consult their own sweet will and pleasure as to where they may halt and when they should go on. The waterway is always lively enough, not only with what you see on either shore, but with the merry parties that meet you in all manner of craft. Paddling quietly up a gentle reach, you hear the measured plash of oars in quick time, and a four-oar outrigger comes swinging round the corner. Or it is the peal of musical laughter that falls yet more agreeably on the ear, and you meet a cushioned and commodious "tub," yawing to the irregular strokes of a crew in light summer dresses and sun-hats, and scattering the stately swans that sail contemptuously clear of it. At each turn the changing landscape breaks upon you in a variety of fresh beauties. It is not only the "crack" scenery you admire—under the hanging woods from Hedsor to Taplow, or in the amphitheatre of beech-covered hills that backs up the Abbey of Bisham. It is rather the combined effects of light and air, sunshine, shadow, water, and heat-haze, that make up an infinite succession of pictures, whose charm is in their graceful composition rather than in the actual details. There is nothing specially quaint about that flat-roofed lockman's cottage, nor in the group of pollard willows at the side, nor in the black gates of the lock, nor in the weed-grown embankments of the weir. But take them in their ensemble in the flood of sunshine, with the fleecy clouds reflected from the water and the shadows of the dancing leaves flickering upon the grass beneath, with the chirp of the birds and the hum of the bees and the flutter of butterflies and dragonflies among the meadow wild flowers, and what can be more picturesque or more inspiring to the genuine artist? For once you feel a certain sympathy with the patient angler on the bank, who poses like patience on a monument behind the drooping rod, which he certainly cannot be said to ply, as he stands watching his float in solemn expectation—a touching embodiment of hope deferred. Were you less agreeably employed yourself, you might almost envy the well-conditioned old gentleman, hung up in his punt between a couple of "typers," with his luncheon basket, his beer-

jar, and his cans of bait. But, by way of change from those placid studies of still life, here we are arrived at the river-side "public," where there is sure to be noise and bustle enough. It has long been a notorious house of call for boating men, fishing men, and cricketers; and the ale and the good old English commissariat arrangements have always been renowned far and near. "Long-shore loungers in blue jerseys and loose trousers are ready on the little landing-stage to lay hold of the bow of the boat, and obsequiously offer you their shoulders for disembarkation. On the gravel sweep above, between the open door and the pole with the swinging sign, are lively groups in flannel of fantastic cut and colour. The doorway is veiled in a light grey haze of smoke from men who are standing before the bar in the passage within, chatting and hob-nobbing over foaming pint-pots, and pulling at everything, from cigarettes to "church-wardens." Should you be somewhat sharp-set after the pull, a glance at the larder cupboard, with the display behind the glass doors, is singularly appetizing. There you see arranged, shelf over shelf, the quarters of lamb and the salads and the cold sirloins and salmon, with a luxury of fruit tarts according to the season. Chops and steaks are of course specialties of the establishment, though you may find the weather somewhat warm for such serious eating. Notwithstanding the turmoil of vociferous customers, the ruddy-faced landlord, stripped to his shirt-sleeves, presses forward to do the honours to the last arrivals, and in all probability he is an old acquaintance of yours. And the barmaid is bustling about in smiles and blue ribbons, with the pretty daughters of the host, who are by no means above their business. Those bright, neat-handed Phyllices may be less ingenious than they affect to be, but there can be no question that their attendance is infinitely more agreeable than that of the normal waiter in rusty black, who appears to hold in abhorrence the water by which he lives. And then if you have the luck to find a table in the open bow-window, you draw in your chair towards the lamb and the gigantic cheese, the crisp lettuce, and the golden butter. And, as you sit looking out on the road and the river over the blooming geranium beds, you fortify yourself against the coming toils of the afternoon, giving yourself over either to chat or placid contemplation.

Some people may think that Hampton Court on a Monday is objectionable; when the tilted vans are drawn up on the green, like so many South African waggons in *laager*; when mobs of excursionists, *en garçon*, in loving couples, and by families, have taken the gardens and the long galleries by storm; when the pairs of turtle-doves in the most gorgeous of raiment are billing and cooing everywhere in the chequered shade; when everybody wears an aspect of flushed festivity, though the sun and their exertions may be chiefly answerable for that; and when the merry games of kiss-in-the-ring are going forward outside the Palace grounds to the general chorus of jokes and laughter. And we have no doubt that the popularity of the place with Cockney excursionists may bring down the value of house property in the neighbourhood. Yet, as a philanthropical onlooker bent on pleasure for the day, we confess to finding pleasure in the pleasures of other people. At all events, the sight is eminently characteristic, and although there is sure to be a good deal of horse-play going on, and though the joviality may be somewhat lacking in refinement, still we have never remarked that the holiday-makers are given to breaking bounds. The presence of their "young women" and "good ladies" seems to exercise a softening influence on the rougher sex; and though certain of the males may have dipped somewhat deeply in the pewter, tea appears to be almost as popular as beer. These worthy folks having started on their return betimes are already far advanced on their dusty journey homewards when, as the shades of evening begin to settle down, you are thinking of dropping down the river yourself; and when, congratulating yourself on having passed a satisfactory day, you resolve to renew its enjoyment on an early opportunity.

BOWS AND ARROWS.

OF that archery which for centuries made English bowmen so formidable in battle, little remains now but its reputation; and though modern archery stands forth its respectable offspring, the features are very different. When the long bow was the principal weapon of our infantry, and when the enemy used to advance so as to present an inviting target to their assailants, the latter shot into the mass, not at individuals; and, therefore, precision was of less importance than a strong pull and a quick loose. Now everything depends on precision. If a man shoots an arrow into the wrong target, he is liable to a fine, and is not allowed to score the hit, even if it happens to be in the centre of the gold. When the object was to disable as many of the foe as possible, rapidity of shooting became a necessary element of success; but now there is no need to hurry; and the target, being no longer of human material, continues stationary, and every arrow should be discharged with care and deliberation. History amply testifies to the efficiency of English archers in actual warfare; but, from its comparative silence as to their doings in time of peace, it can only be surmised whether they ever voluntarily practised at marks or kept their hands in by shooting hares and rabbits. It is probable that they did neither, since legislation was constantly required to encourage or enforce the use of the long bow, one statute decreeing that every father should provide a bow and two arrows for his son when he reached the age of seven, and another obliging every one ex-

cept the clergy and the judges to shoot at butts. Those in power were well aware of the importance of familiarizing the population with the handling of a bow; and knowing that, when once properly trained, there were no troops in Europe who could stand against our yeomen archers, they not only compelled them to practise archery during their spare hours, but, when war was threatening, ordered the sheriff of each county to furnish suitable bows. In these degenerate days the liberty of the subject could not be interfered with in such an arbitrary manner, and consequently the want of practice is as much the failing of modern archery as of its prototype. It is this inertness, or rather the disappointment of failure caused by need of training, that renders lawn-tennis so dangerous a rival to archery just now. That entails neither solitary toiling, nor a succession of blank targets as the possible result of a morning's work; in fact, it is an admirable game, full of healthful exercise and social intercourse, and will not die out, as some imagine, like croquet and skating-rinks; but, in spite of its descent from *le jeu de paume*, it can hardly claim historical equality with archery.

It is curious to find how ignorant people in general are of what they call "playing at bows and arrows." They know literally nothing about it, its antecedents, or its present achievements, and they learn with surprise that it is firmly established all over the kingdom, and has its headquarters in the Regent's Park. They regard the exploits of their ancestors at Agincourt or Towton, and the ideal performances of Robin Hood and his merry band, with a similar complacency, and are more ready to believe that the hero of Sherwood Forest could split a willow wand at 100 yards than that a lady of our day could shoot three arrows in succession into the bull's eye at 60 yards. The fact that the *Times* only briefly refers to archery once a year may be regarded as an unfortunate proof of the little interest it excites beyond its own circle. There can be no question as to its growth during the last five-and-twenty years, not merely in the springing up of new societies, but in a knowledge of the real principles of shooting; and though it may not show any strong signs of development at the present moment, who knows but what it may some day become fashionable? The tastes of our forefathers are in vogue, and if old houses, old furniture, and old china are found to harmonize with modern enlightenment, archery may take its turn among the revivals. It may lack the bustle and excitement that attend other amusements, but sooner or later people may realize the hollowness of much that they now worship; and when the London season shall have been curtailed, and the freer country life made more of, they may be glad of the quiet exercise and healthy rivalry to be found in the "witchery" of archery.

As a recreation it dates from the close of the last century, when the Royal Toxophilite Society came into existence, and during the interval between that period and its discontinuance in battle, archery all but expired. A century ago it showed signs of life, and after its long sleep awoke in a new sphere, i.e. it had risen from the ranks, and has since remained in the particular set that inaugurated its second career. Literary and scientific men find in it a soothing antidote to the troubles of the brain, and also that thorough, but at the same time unfatiguing, exercise of which their bodies stand in need. All sedentary workers who care for any exercise at all value it as a midway restorative between labours done and labours to come, those living in London being additionally grateful for the glimpse of country it affords. None but archers can understand the real pleasure and enjoyment to be got out of the mere sight of green lawns and tempting targets, or out of the music of the twanging bow. They may be physically unfit for more violent exertion, and therefore gladly welcome a friendly bout in which all the attractions of amusements beyond their powers are combined with less effort; but it is not all plain sailing, though the "labour they delight in physics pain." A York Round will occupy two or three hours, according to temperament and temperature, and the archer knows he has his work cut out for him and must do it all himself. A companion is no doubt an acquisition, but he is not a partner who can, as at lawn-tennis, help to raise the score; nor, on the contrary, can that companion divide the honour and glory of the score. The archer soon warms to his task, his powers are called forth for sustained effort, and no arrow is let go until its order of release has been thoroughly considered. If in the result he beats his best previous performance, he is supremely happy; if otherwise, he has the consolation of feeling or hoping that on the very next occasion he will at least outdo that day's work. Unfortunately, many find this a drudgery, and only undergo it as the necessary prelude to or preparation for the pleasanter ordeal of a prize meeting.

Ninety years ago a great public archery gathering had a more national significance than now. It was more numerously attended, and every competitor felt a proper pride, as well as a personal pleasure, in what was as much a tribute to the past glories of English archery as a contribution to its present progress. He might not hit the target all the afternoon, many did not; but he was helping by his presence to perpetuate a pastime associated with the proudest memories of his country. The scene, too, was more glittering and picturesque. Tents were plentiful, and were brightened up with banners of the different societies; there was a greater variety in, and more attention paid to, the uniforms of the shooters; and generally more pomp and ceremony were observed. *Tempora mutantur*. Now the occasion wears a more serious and businesslike aspect. Men study comfort rather than appearance in their shooting garb, and dispense with all unnecessary trappings. They mean to make big scores, and, with "centrum peto" never out of their thoughts, there is no room or inclination

for any reflections but those of present success. Shooting has improved to such an extent that, with half the number of competitors, the gold is struck as often as the target was before, and an officer's time is wholly occupied in measuring the distance of such hits from a pin-hole centre. Country archery clubs vary considerably in their constitution. Some are limited to a few members who own country seats, and who take it in turn to be hosts, and organize the meetings, and these, it is to be feared, regard archery as merely an adjunct to the social success of a garden party. Other clubs have their regular grounds, where practice meetings are held once a week, and prize meetings once a month, during the archery season. One large and flourishing club near London is managed almost entirely by a committee of ladies, and the members—male and female—are classed together, according to their capabilities. By this means, and by a system of percentage deductions, regulated by previous scoring, the chances of success are equalized.

With individual shooting, the best style does not always appear to meet with the best result, and it is unsatisfactory to see how successful a tricky style may be for a time. An experienced archer may suddenly find himself at fault, when his form and loose are apparently perfect, and when, after several weeks' successful practice, his precision seemed a matter of absolute certainty. His precision vanishes unaccountably, and the score hardly moves. It is then that his superior knowledge comes to the rescue, and his advantage over the superficial archer becomes evident. The data upon which, one by one, he has built up his archery lore stand him in good stead, and he is able to test each in turn. The intricacies of aiming, alteration of position, judgment in loosing, allowance for wind, command of temper, may all have a share in helping him to discover how his hand has lost its cunning. The bowstring striking the left arm and drawing it out of the true line with the bow, his getting his head unconsciously too far forward or back, not pulling up each arrow uniformly, or some other trifling irregularity of that sort, may have caused the mischief. But if the tricky archer fails in any of these respects, and gets baffled, he has no resources to fall back upon, and his previous disregard of the rudiments of aiming, drawing, and loosing will probably cause him to aggravate his fault. Some people shoot with very light tackle, and can do nothing in a high wind; whilst others shoot with bows beyond their strength, and the end of the round finds them fagged and unsteady. Standing just behind each shooter in turn, an outsider would certainly marvel that arrows, all of which are intended for the bull's-eye, should have such different manipulation and so many starting-points. He might notice, too, that some people never look at the target they mean to hit; that some have no aiming-point at all; that some shut one eye, and so weaken the general vision; that some keep both eyes open, and see two targets instead of one; and he might, but we trust would not, come across a specimen of that archer of whom it is recorded that when his arrows flew towards Islington his eyes went clean towards Pimlico.

At all public archery meetings ladies shoot at separate targets, but alongside those for the men. There is, however, no rule to keep the sexes apart, and consequently between the ends the men frequently stray into the neighbouring camp. A husband goes to see that his wife is shooting up to her usual form; a father to ascertain the state of his daughter's score; a young man in attendance on some fair beginner to tighten up her bow, splice the bowstring, or buckle her arm-guard; while others are on the prowl for a little prattle, or to render some such service as searching for a lost arrow, pinning up a refractory sleeve, or informing a near-sighted damsel whether her arrows fly over or under the target. Those who watch an archery meeting for the first time cannot be otherwise than gratified at the novelty of the scene, and the eccentric positions of the various shooters will perhaps add a relish to their gratification. But in archery, as in many things, the delight of the spectator is nothing to that of the performer; and the only way in which he can retain and heighten the interest aroused by his first impressions of what archers may do is to take up his bow and arrows and go and do likewise. They may not yield the exhilarating thrill of those pleasures which are wooed only when life is at its strongest and the pulse fullest; but, when joints stiffen and muscles relinquish their first youth, archery will not fail to supply all that is desirable in the way of health and enjoyment.

THE CHEAPNESS OF MONEY.

SINCE the end of April the Bank of England rate of discount has been 2½ per cent.; but, low as is that rate, the Bank has been doing no discount business proper. When the fortnightly Stock Exchange Settlements come round, those who have good credit and who wish to use it for the purpose of lending money on the Stock Exchange, discount bills at the Bank of England, and then advance the proceeds at a much higher rate to speculators on the Stock Exchange. But of real commercial bills there are none worth speaking of discounted at the Bank. The real rate in the open market for bank bills is only 1½ per cent., and even for really good commercial paper the rate is barely 2 per cent. Even on the Stock Exchange itself, much as we hear of the magnitude of the speculation which is carried on there, the banks have lent at the Settlement this week at an average rate of about 3½ per cent.; and it is to be remembered that this week being the last of the

half-year, money has been exceptionally scarce. In Paris, again, in spite of the continued drain of gold for so many years past, and of the wild speculative mania there prevailing, the Bank of France rate is only $3\frac{1}{2}$ per cent., and the outside rate is lower still. So, furthermore, in New York the rate for prime commercial paper varies from about $3\frac{1}{2}$ to 4 per cent.; yet the United States are enjoying a prosperity which, perhaps, has never been exceeded in any age or country. How is this extreme cheapness of money to be explained, while trade is so prosperous in the United States, and has decidedly improved here in Europe, and while speculation is rampant all over the world?

The first and most general cause is the change that has taken place in the conduct of business, owing to the extension of telegraphic communication all over the world. Formerly when a person wished to remit money—say, from Calcutta to London—he went to one of the Indian banks, and obtained there a draft upon the head office in London, or on some other London institution, on which the Indian bank was authorized to draw. He then sent this draft, usually running for four or six months, to the person who was to be paid in London, and by the receiver the draft was discounted at his own bank. That is to say, the person receiving the draft, which was not payable for several months afterwards, wishing to obtain the money at once, went to his banker, or to a discount house, and sold the draft for a price somewhat less than its nominal value. What was done in this ideal case by the person in Calcutta was also done by people all over the world who wished to remit money to England and by people in England who wished to remit abroad. In this way there was constantly afloat an enormous volume of bills, all of which had to be discounted by those who desired to obtain the value represented by them sooner than the bills themselves fell due. And, consequently, there was a steady and a very large demand at all times for discount—that is to say, for the advance of money by banks on the security of these bills. Now, however, that every important town in the world is connected with every other by means of the telegraph, this manufacture of bills has been immensely reduced. A person in Calcutta who to-day wishes to remit to London usually goes to his banker there, and, instead of obtaining a draft as formerly, he pays the money into his banker which he wishes to have remitted to London, and instructs the banker to order it by telegraph to be paid by his correspondent in London to the person entitled to it. The whole proceeding is now completed, so far as the sender and the receiver of the money are concerned, in the course of a day or two at the outside. No bill need be manufactured at all, and very often no bill is manufactured; and there is, consequently, no discounting. In this way alone there is an enormous reduction in banking business. The banker now, in fact, gets only a commission for the service he performs in receiving the money abroad and paying it at home, or *vice versa*, instead of, as formerly, receiving the money and having the use of it for several months to run, while there is no need for accommodation from the second banker, who formerly discounted on its arrival the bill which was not payable till these months had elapsed.

This extension of the telegraph has had a great influence in another way, in dispensing with the services of the middleman and economizing money. Formerly, when a voyage from the East occupied several months, it was necessary to keep on hand a large stock of all kinds of commodities. The business of importing and exporting consequently was monopolized by merchants with large capitals or great credit, and these merchants had to maintain immense warehouses, and to keep ready for their customers vast stocks of goods. But now a message may be sent from London to Calcutta, Shanghai, or Melbourne in the course of a few hours, and goods may be ordered from any of these places. By means of steamships, and by the opening of the Suez Canal, the voyage home is greatly reduced; and, consequently, instead of taking several months or perhaps more than a year to order and get home goods, it now takes only a few weeks, or at the outside a couple of months. In this way the stocks of goods required to be kept on hand are much less than they used to be, and consequently a merchant requires a very much smaller capital invested in his business. A capital, let us say, of 100,000*l.* is turned over again and again several times in the course of a year now, whereas formerly it was not turned over more than twice, or perhaps even not more than once. To do the same amount of business, therefore, two, three, or it might be four, times the capital now necessary was formerly required. Moreover, there were required much larger warehouses and a much larger staff of *employés* of all classes. This economizing of capital enables the merchant to dispense with the aid of the banker much more than formerly. It is clearly a displacement of the middleman, and it works to the advantage of the small trader and to the disadvantage of the great capitalist. It will be seen immediately how it helps the other causes we have already mentioned in cheapening money, in so far as it dispenses with the locking up of capital. The extension of the telegraph and the improvement of locomotion, in fact, have tended to mobilise capital, and therefore to dispense to a very large extent with the banker and the discount house.

In still another way it has done this, for it has cheapened in an extraordinary degree the prices of commodities. The prices of commodities now are not higher than they were before the great gold discoveries in California and Australia. To some extent, no doubt, the fall in prices during the last seven years is due to a diminution in consumption. And to some extent also, perhaps, it is due to the growing scarcity of gold. But, above all, and

mainly, it is due to the lessened cost of production. As we have just been saying, a very much smaller capital is now required to conduct business than formerly was, and consequently smaller profits are required. The smaller the capital the smaller the return necessary to give a fixed rate of interest. Again, by this lessening of the amount of capital required to carry on business, merchants are able to dispense with the aid of the banker, and consequently have not to pay as much interest as formerly upon the money they have invested in their business. Furthermore, not being obliged to keep the immense stocks which they formerly had to keep on hand, they have not to charge interest for all the time their money is lying idle, locked up in the goods in their warehouses. The merchant who had to convey goods from the East, and to keep them in his warehouse for months, had necessarily to charge higher prices than the man who now is able to dispose of them in half, or perhaps a quarter, of the time. Moreover, the diffusion of capital all over the world has reduced the rates of interest. The constant investment of English capital in India, China, Australia, and America has brought down the rates of interest in these countries, and consequently the farmer who grows grain, or cotton, or silk, or tea has not to pay the enormous sums which he formerly did, and therefore is able to sell for a lower price. In all these various ways, and in others which it is not necessary to trace in detail, the cost of producing commodities has been immensely reduced, and, as a consequence, the prices of these commodities have likewise been reduced. But the lowering of prices still further lessens the amount of capital needed by the merchant to carry on his business, and therefore dispenses to an additional degree with the aid of the banker.

These causes are general and permanent in their action, and we might add to them the growing scarcity of sound investments; but there are other causes, local and temporary, which aid in cheapening money. One of these is the disappearance of the houses which formerly lived upon the credit to which they were not entitled, and carried on an immense business by means of accommodation bills. To take the most notorious case, that of the City of Glasgow Bank. It will be recollected that for years that institution lived by the manufacture of bills. It gave credits to its customers all over the world, and kept them going by means of bills drawn upon itself. These bills circulated all over the East, in India, China, and Australia. They were eagerly competed for by the Eastern banks, and they were discounted to enormous amounts in the London market. The failure of the City of Glasgow Bank alone removed from the market bills to the amount of about $3\frac{1}{2}$ millions a year, and the various houses which came down with that bank removed also another large volume of paper. So in the same way the Colliers, who failed two or three years previously, had carried on a large business in the same way, and their bankruptcy removed from the market another vast amount of bills. Altogether, perhaps, it is within the mark to say that five or six years ago there were in circulation 10 or 12 millions of bills which have now ceased to exist, and of which there are no counterparts. It may be said that these bills represented nothing, and to a large extent, no doubt, it is true they did not; but they were at the time supposed to be valuable, and they were eagerly competed for. They therefore gave employment to large sums of money, and helped to keep up the value of money in the discount market.

There is one other cause of great potency which is influencing the money markets of Europe; that is, the agricultural distress. In the United States, as we have already said, there is and has been for the last two or three years extraordinary prosperity, and that prosperity has given a stimulus to trade in Europe; but the long succession of bad harvests and the extreme distress which has thus been brought upon the agricultural classes here have prevented that improvement from increasing as had been expected, and have kept the whole community poor. Even now agriculture is the greatest industry in the United Kingdom, and upon the Continent it is not only the greatest single industry, but it is greater than all the other industries put together. Distress, therefore, among agriculturists weighs upon the prosperity of all other classes. It has prevented the stimulus to trade which was imparted by the prosperity in the United States from developing and increasing even in England, and until it comes to an end we cannot expect to see real wellbeing. Trade undoubtedly is improving, but the improvement is still in an incipient state, and will not become marked and general until we have had at least one really good harvest. But this comparative dulness of trade keeps down the demand for money, and consequently prevents its value from rising.

THE THEATRES.

ALTHOUGH their courage did not suffice to give more than one performance, it is creditable to the Saxe-Meiningen company that they should have given Goethe's *Iphigénie auf Tauris* on Saturday, the 18th, at all. As their strength is supposed to lie in the presentation of crowded scenes, and the uniform good drilling of a large company, it was courageous in them to play a piece in which only five actors are required, but in which all those actors must be good, and that in the most delicate branches of their art. The poet's intention was to write a classical play, and that was supposed to require, according to the critical canons of his time, a careful suppression of emotion and an avoidance of stage effects, carried to the length of almost making the play

unfit for the stage. He seems to have thought, in common with all the critics of the time, that what it is the proper tradition to call the repose of Greek dramatic art was due to deliberate choice, and not to the necessity of writing for actors who performed on stilts and shouted through speaking trumpets fixed to their masks. Influenced by this theory, he sacrificed the propriety of dramatic action throughout to the verse, and was guilty of such clumsy passages—if that word may be allowed of the work of so great a man—as the one in which Iphigenie discovers that the captive whom she is about to sacrifice to Diana—a modern poet would say Artemis—is her brother Orestes. It is contrary to nature and to the perspective of the theatre to allow Iphigenie to stand silent through a long speech, and then deliver an address to the gods herself before she tells Orestes who she is. It is really equally contrary to the example of the Greeks. But, however little the long speeches of Goethe's play may be in place, they are all beautiful in themselves, and, with fine elocution and delicate rendering of character, can be listened to with pleasure throughout. Unfortunately the Saxe-Meiningen company, as a whole, appeared to less advantage in this than in any of the plays they have as yet given. The impression produced should have been artistically complete, but, in truth, everything depended on Herr Barnay as Orestes. What he did was excellently done; the other parts were not done at all. Herr Nesper's Thoas, Herr Arndt's Pylades, Herr Richard's Arkas were marked by all those faults of unmeaning gesture and unobtrusive diction which we have already noted in these actors. Frl. Haverland, in Iphigenie, justified the opinion we have always expressed about her. In certain forms of the domestic drama she would, we have no doubt, be a good actress, but she wants the poetic faculty to play such parts as this or as Hermione. In her movements she "rings the changes" on certain stock gestures, and her elocution, though clear, is unintelligent in the placing of the accents. She increases and diminishes the stress of her voice with very little regard for the meaning of the words—a fault which entirely spoiled her declamation of the beautiful lines which close the first act.

We have expressed our opinion of the worth of Herr Barnay's performance of Orestes; to describe it is less easy. It is indeed an artistic interpretation of the highest order, finished in detail, but with the details kept in proper subordination, and not allowed to fritter the work away. As his fellow-actors seem all to have been formed by one master, we can only regret that it cannot have been Herr Barnay. He could not have given them his voice, at once so sweet and so powerful; but he could show them how to use what voice they have with intelligence, and how to make their gestures free and graceful. His own movements had these qualities, controlled by a perfect taste. He was sober in his use of gesture, and yet was always acting, even in repose. He showed the terror—such terror as even the Furies can make an Orestes feel—as much when looking in desponding silence out to sea as when he tells Pylades how he hears his persecutors howling round the grove of the Tauric temple.

Die Verschwörung des Fiesco zu Genua was better fitted to show the qualities of the company. The splendid Italian life of the sixteenth century lends itself admirably to the making of great stage pictures, and Schiller's play requires good melodramatic vigour rather than delicacy in the acting. As a whole, the drama is incoherent, the scenes follow but do not produce one another. Fiesco is a stage conspirator, who plots unnecessarily and for the obvious purpose of making a confusion, and, as in *William Tell*, there are different plots which are not properly combined. But the scenes in themselves are most effective, and the minute directions given by Schiller show how profoundly he felt stage effect. The play was put on the boards with the almost dazzling brilliance of scenery and dresses for which it affords such ample opportunity. There is not a scene in it which does not pass either in some magnificent interior or in a romantic street full of picturesque figures. Even if the company were less well drilled than it is, many of the scenes would be worth seeing and remembering for the sake of the scene-painting. The curtain rises on one of the most beautiful of all, the masked ball in Fiesco's palace, crowded at times with magnificently dressed figures, and the play is continued on the same key. The effect produced when the curtain is drawn back from the window of Fiesco's palace in the third act, and Genoa is revealed in the moonlight, and later again in the gradually increasing light of dawn, is overpowering. It certainly overpowered Herr Nesper, who played the Count of Lavagna, and who shrank into insignificance amid his gorgeous surroundings. The furious passions of the *dramatis personæ* are fully worthy of their showy trappings. Their love, hate, and ambition are all in the superlative degree, and find expression in appropriate language. The actors were unhappily not able to resist the temptation thus afforded them to be merely loud. With the exceptions we shall mention, their "Jealous pangs and desperation, Fury, frantic indignation, Depth of pains and height of passion," were expressed in one almost continuous shout. Of the actors, Herr Teller, who played the villainous and comic Moor, was, as he always is when Herr Barnay is not on the stage, by far the best. His abject appearance, and the defiance produced by his very despair when he falls into the hand of the master he has betrayed, remain on the memory as one of the few pieces of real acting to be seen in the whole performance. Herr Kober was striking, and withal firm and self-controlled, in his rendering of the small part of Rafael Sacco. The female parts reached a better average. Frl. Werner was indeed somewhat disappointing, owing to the marked contrast between her wild gestures, the agonized tone of her voice,

and her unvarying smile. Her best scene, at the end of the first act, but her impersonation was intelligent in conception. Frl. Moser-Sperner played the part of Leonora with spirit at all times, and in the comedy passages with delicacy. Frl. Habelmann, however, is due the praise of having given the brightest and most original impersonation seen in the evening in the part of the insolent and luxurious Julia Imperiali. It is perhaps on account of the anti-star system of the Saxe-Meiningen company that we have seen so little of this excellent actress.

We do not envy the man who could not derive unmixed satisfaction from Heinrich von Kleist's "großes historisches Ritter-schauspiel," *Das Käthchen von Heilbrunn*, as done by the Saxe-Meiningen company. Wherever and however it was done, it would be full of the charm which is conferred by the unexpected and the perfectly inexplicable, and at Drury Lane it is splendid into the bargain. It begins with the tragic and mysterious Vehmgericht which all know, or at least ought to know, well from *Anne of Geierstein*, and it tails away into a farce. There is a wicked and beautiful Kunigunde von Turneck, who, apparently from what the American language calls "pure cussedness," spends her leisure in setting all Swabia by the ears, who is carried off and rescued, makes plots and unmakes them, and wishal wears a wig, and poisons innocent maidens who have seen her bathing. Then there is the innocent maiden who has committed this indiscretion quite involuntarily, and who by some happy accident turns out not to be poisoned after all. This is *Das Käthchen*, the heroine, a damsel who has been shown her future husband on New Year's Eve by an angel, and who, when she meets him, not only breaks a great deal of crockery in her emotion, but follows him about "wie ein Hund," in spite of his resistance, with an "empfindsamkeit"—the virtue can only be adequately expressed in German—which is proof against not only scolding, but even the birch-whip. This *Käthchen* is the daughter of one Theobald, an armourer of Heilbrunn, during four acts, but then is shown to owe her existence to no less a person than the Holy Roman Emperor. The young person not only triumphs over the wicked Kunigunde, but proves that she, at least, owes none of her charms to art by taking off her stockings on the stage. At a critical moment of the drama they are waved in ecstasy by the faithful squire of her true love, the same who corrected, or threatened to correct, her with the whip, and is ultimately rewarded by marrying her. The angel who visited *Käthchen* on New Year's Eve does her the further service of bringing her safe out of the ruins of a burning house, into which the valiant German knights present have allowed her to go to save a picture. The picture is that of Friedrich Graf Witter vom Strahl. This Graf vom (not von) Strahl is the hero shown to *Käthchen* by the angel, and who devotes all the time he can spare from fighting to lamenting his inability to marry *Käthchen*, and making effective love to Kunigunde, till he is disabused by seeing that artful woman without her back hair. These three characters are supported by a long list of squires, knights, grafes, a bishop, and a kaiser. With the help of German the play is delightful; but to enjoy it thoroughly the spectator should have to depend on the sketch in English published in the little yellow book of the play issued as an "offizielle Ausgabe" by the company. Then he will enjoy the unexpected and the inconsequent in all their purity.

The acting of this play strikes us as being perhaps the best as a whole, with a doubtful exception in favour of *Twelfth Night*, which we have yet had from the Saxe-Meiningen company. Perhaps this is partly due to the fact that we did not expect anything very much like nature, but it is certainly also owing to the real merit of the performers. Frl. Habelmann made as good a Kunigunde as she had a Julia Imperiali. Frl. Schweighofer was an excellent *Käthchen*. It is a matter of course now bordering on the tedious to say that the drilling of the company was beyond praise; but there is one point which we think particularly worthy of mention, the admirable way in which armour was worn by them all. It must be long since our stage could show such a crowd clanging about in mail as if they had worn it from boyhood. Herr Nesper as Graf vom Strahl, and Herr Teller in the insignificant part of the Rheingraf vom Stein, wore heavy suits of plate armour nearly all through the piece, and the latter performed the striking gymnastic feat of kicking a vassal, with all this weight on him, in an easy and natural way. For this and other excellences in the acting of his villainous, though small, part he was deservedly called before the curtain. We feel bound to make particular mention of two of the actors in minor parts. Herr Arndt, of whose Pylades we were forced to disapprove, delivered a long monologue as Kaiser, with intelligent elocution and just emphasis. Herr Heine, as Georg von Walddetiden, of course armed *de pied en cap*, gained loud and well-deserved applause by rolling about in a burst of hearty and spontaneous laughter—a thing too rarely heard on any stage.

After a revival of her very successful part of Ninon, Miss Wallis has been playing Juliet for a series of nights at the Olympic. It is perhaps a consequence of her long performance of a melodramatic character that the best passages of her impersonation should be the harder and more tragic ones. In the lighter parts her comedy is apt to be trivial; while the passionate love scenes are wanting in delicacy, notably in the most difficult of all—that of the balcony. Her acting here was destitute of tenderness and of the high poetic feeling without which the situation almost becomes absurd and the language seems

suggested. With the worse her acting is too childish; and, moreover, their little quarrel and reconciliation is dragged out by a long period of almost byplay, which borders on farce. Her despairing appeal to Friar Laurence and the famous soliloquy were much better. There was even considerable power in her representation of Juliet's horror and doubt. It would be unreasonable to expect a high level of acting from a "scratch" company such as Miss Wallis has to support her, and we should not have been disappointed if it were worse than it is. Mercutio (Mr. E. F. Edgar) we do not feel called upon to describe, but the minor parts of Friar Laurence (Mr. Ryder) and of the Nurse (Mrs. R. Power) were well done. Mr. R. B. Mantell's Romeo, without being either original or powerful, shows promise. He was generally graceful and well-bred, acting with good artistic intention, although he is not able to avoid the temptation to be loud in the passionate passages. We must protest against the stagey and melodramatic nature of some of the scenic arrangements. It is unnecessary and in very bad taste to show us Romeo and Juliet kneeling at the altar in a flood of rose-coloured light, and there are many other such tricks in the performance.

The revival of *Hamlet* at the Lyceum is interesting in several points. Miss Ellen Terry's Ophelia has, if anything, gained in beauty and tenderness; and Mr. Irving's Hamlet is in some not unimportant points a proof of his unremitting thought and study. The character seems now informed with a deeper tenderness; as an instance of which we may refer to the delivery of the words "Am I not i' the right, old Jephtha?" At the same time the irony appears finer and the passion more concentrated. The scenes in which we have least liked Mr. Irving's impersonation are the ghost scenes; and here, with the restored speeches to the "old mole," we find a closer approach than was before attained to the hysterical gaiety which, to our thinking, belongs to the passage. On the whole, Mr. Irving's Hamlet may be said to have gained both in power and in fineness. Mr. Terrie's Laertes is worthy of his Cassio until the rebellion scene, in which he seems to fall somewhat short. Mr. Howe's Polonius is the best we have seen. He presents the chamberlain as an old gentleman whose fine manners and knowledge of the world are consistent with the estimation in which he is held by the King and Queen, and with the wisdom of his advice to his son; and he also indicates Polonius's fatuity without a touch of burlesque or exaggeration. This is especially apparent in his announcement of the players' arrival. Mr. Tyars shows us a far more plausible king than is generally seen. The stage management has been greatly improved by a variety of changes, small in themselves, but important to the whole effect of the play.

REVIEWS.

MR. JEFFERSON DAVIS'S RISE AND FALL OF THE CONFEDERATE GOVERNMENT.*

FEW events, in all probability, occurring in a foreign country more profoundly stirred, not merely the political, but the personal feelings of Englishmen, on the one side or the other, than the struggle, now nearly twenty years old, between the United and the Confederate States of America. Not only did it cleave English political associations with a clean cut across all its strata, but it was the ever-fresh subject of never-ending argument over every fireside and in every coffee-room. Foreigners, for the most part, cast in their lot with the North. Those who thought themselves Conservatives could not or would not understand where the basis of sovereignty was found in America. To Liberals, again, the deplorable inheritance of slavery concluded the matter; and in their estimation any inhabitant of the Old Continent who could venture to drop a word of sympathy for the struggling South was a rebel against light and a conspirator against liberty. The verdict of these friends of mankind was irrefragable, for it was based upon those inalienable rights of humanity, which are never so precious, or so clearly blaze out upon the great page of the open world, as when they happen to come handily into the keeping of some terribly earnest majority whose interests and whose principles may happen to combine in the mandate to irritate, to crush, and to insult an inconvenient minority.

Of course the cause of the Southern States stood condemned, prejudged, unheard, and with no hope of appeal, by those men who could not conceive that there was any power for good—we are too tender to their susceptibilities to say any Providence—in the world before the revelation of the immortal principles of 1789. In this country, however, which knows not 1789, the South could advance a claim which was largely conceded as deserving of candid consideration by constitutional Englishmen who can appreciate that liberty is the growth of positive law, of solemn compact, of respect for property, for tradition, and for reciprocal confidence.

The old familiar designation "United States" presented itself to the reason of Englishmen as one which possessed a definite meaning. But this plural phrase involved ideas differing from

those which must have grown up if the appellation "United people of America" had been the title which had been brought into formal use to designate the same community; so it was evident that to use the expression which did exist, as leading to the same conclusions as those which would have arisen out of the one which did not exist, was to beg the question. If there were States which had been organized and which had acted as States before they had by some voluntary and reciprocal action united—and which could, therefore, upon the same hypothesis, continue to be States after they might by any accident have found themselves disunited—then the necessity would follow that each of these States counted for something within the so-called Union beyond merely a given area of soil and a given unit of population. The State must have rights of some sort or other, which could only be ascertained by reference to the teachings of history and the interpretation of documents. The analogy of the Scotch and Irish Unions was worth nothing unless it could be proved that the agglutination of Virginia and Massachusetts—consummated as that was upon the condition that each of them preserved its internal framework of commonwealth, and had to combine for the outside regulation of reserved questions in a Congress of restricted capacity, which was itself the result and product of the alliance—could be the same thing as the fusion of the Parliaments of Edinburgh and of Dublin with that of Westminster into one Imperial Parliament, in which the traditions of the respective factors were concentrated. In short, a section of English political society, sufficient by status, by character, and by general respect to claim and to hold its own opinions, refused to accept the verdict of popular clap-trap, and protested against stigmatizing as rebels men whose rebellion simply consisted in believing that their allegiance was primarily due, not to a partnership called a Union, which, as they contended, existed under conditions presupposing the possibility of its dissolution, but to that sovereign State of which each one might be a citizen, and in so being alone belonged also to the Union. The controversy as seen with Southern eyes and in reference to the treatment of the crushed Confederacy by the exultant North is referred to with much pathetic dignity by Mr. Jefferson Davis, once President of the seceded States, in his lately published *Rise and Fall of the Confederate Government*.

The plea of necessity could, therefore, no longer exist for hostile demonstration against the people and States of the deceased Confederacy. Did vengeance, which stops at the grave, subside? Did real peace and the restoration of the States to their former rights and positions follow, as was promised, on the restoration of the Union? Let the recital of the invasion of the reserved powers of the States, or the people, and the perversion of the republican form of government guaranteed to each State by the Constitution, answer the question. For the deplorable fact of the way for the cruel manner in which it was waged, for the sad physical and yet sadder moral results it produced, the reader of these pages, I hope, will admit that the South, in the forum of conscience, stands fully acquitted. Much of the past is irremediable; the best hope for a restoration in the future to the pristine purity and fraternity of the Union, rests on the opinions and character of the men who are to succeed this generation; that they may be suited to that blessed work, one, whose public course is ended, invokes them to draw their creed from the fountains of our political history, rather than from the lower stream, polluted as it has been by self-seeking place-hunters and by sectional strife.

Slating slavery, as Englishmen righteously continued to do, the more impartial antagonists of that detestable institution were candid enough to admit that the existing generation of Southerners were the victims of circumstances, of the origin of which they were guiltless. Towards the slave trade—the most loathsome feature of African slavery—the Southern States had in the years which had elapsed since its abolition become implacably hostile, and in regard to the social condition of the black population, while there were undoubtedly most deplorable incidents, the real facts did not carry out the sensational assertions of fiction, and New England romances were no longer accepted as indubitable history. It was certainly a sharp disappointment to those who were looking for a satisfactory settlement that no indication had been given of the determination to lay the axe to the root of the tree so soon as the sword could be exchanged for the axe. Practically, however, it was appreciated that men engaged in a life-and-death struggle for existence were not in a condition to enter on social changes, compared with which the Irish Land Bill is a light bagatelle. The friends of the South, at all events, were convinced that, if the Confederates won, a more workmanlike scheme of emancipation was in all probability in store for the future than that which was likely to emerge out of the success of the other side, controlled as it would be by politicians to whom the vote of the negro would be of more importance than his education or salvation.

The cynical outrage upon international rights on board the *Trent* of course intensified the feelings of a people who had not yet been educated at Geneva and in the Transvaal to a due contempt of that which nations used to deem most precious. The heroic deeds of leaders such as Beauregard, "Stonewall" Jackson, and Lee, was no doubt the most efficient factor in creating a public feeling favourable to the South; but there were political thinkers who had before the name of Bull Run had emerged from its natural obscurity convinced themselves, by the study of the legal arguments of Mr. Davis, Mr. Benjamin, and other Southern leaders, that, at all events, the secession of so many sovereign States was not a purposeless and indefensible rebellion, but the solution—rough and ready, but in the ideas of those who were responsible, the only possible solution—of a question which had at least an ostensible legal justification that had hitherto been too much overlooked by those on this side of the Atlantic, who were apt

* *The Rise and Fall of the Confederate Government.* By Jefferson Davis. 6 vols. London: Longmans & Co. 1881.

unconditionally to accept statements prepared at New York or Boston for the English market. One instance of many may be given to show how clean and sharp was the cleavage that separated English society upon this particular topic. Out of the two earnest Liberals who then stood forward as members for Birmingham, not yet a unicorn constituency, Mr. Bright made himself conspicuous for his active zeal on behalf of the North, and Mr. Scholefield of the South.

This drift of sympathetic feeling was intensified by Mr. Gladstone's unexpected declaration that Jefferson Davis had made a nation. Rapidly explained away as was this declaration which had been thrown off by the most impulsive of orators, it could not be wiped out by any amount of ingenious explanation; it was the word that had indeed flown abroad, irrevocable, to the vexation of the friends of the North and to the comfort of their opponents.

Then, as was natural, considerations of a less disinterested character asserted themselves, and Southern sympathy very frequently meant money staked upon the Cotton Loan. With the waning fortunes of the Confederacy its popularity among fair-weather or self-interested friends naturally waned in a like degree. But its hold upon the respectful sympathy of independent and educated Englishmen of all political opinions was too reasonable to be lightly shaken; and, if Mr. Jefferson Davis could have brought out his apologetic narrative close upon his loss of power, the history, written by the prime actor in the events which it chronicled, would, in all probability, have made an appreciable sensation. But the prisoner, treated with rigorous cruelty and placed upon his trial for his life on a charge of high treason, was not in a condition safely to vindicate actions and words which, in the eyes of his prosecutors, were the very corpus of the indictment. Many things had to be done and undone, many truths to be learned and many delusions forgotten, before the President of the Confederate States could with safety or decency address a nation, to the majority of whom he had lately been a felon, in the position of advocate at the bar of history for the *raison d'être* of that which, if not justifiable separation, was treason and rebellion.

To drive time back is, however, not given to man, and in the years which have passed since Lee surrendered at Appomattox Court House, the world has been travelling at a bewildering pace. Great wars have raged, and deafening rumours of wars have thundered. France and Mexico, Prussia and Austria, Germany and France, Russia and Turkey have measured swords, and the political map of Europe has been revolutionized. At home such changes as Irish disestablishment, general primary education, purchase abolished, the Universities secularized, the judicature reconstituted, household suffrage, and the Ballot have agitated society. Meanwhile a generation is growing up to whom not only the picturesque incidents of the American struggle are ancient history, but even some of the events which have happened nearer home, and since the collapse of the Confederacy.

It could hardly be expected that general students of history who had not hitherto had their thoughts arrested by that special episode would have their time and their minds sufficiently disengaged to commit themselves to mastering a long calm detailed narrative of that particular chapter of the world's progress drawn up so as to appeal to the judgment rather than to the feelings of its readers. A rapid rhetorical sketch of the events between the first shot fired at Fort Sumter and the capture of the outlawed President might even now secure that general popularity which an interesting tale—unknown to many, half forgotten by the rest—is likely to win if only signed by a distinguished name. But it would have been incongruous and hardly decorous for Mr. Jefferson Davis, after seventeen years' silence, to appeal to the reading public merely as a rhetorician. Official responsibility has its obligations, and it dictated that, if he should feel it his duty to speak at all to the Epigoni, he should do so in language which only the President of the Confederate States could efficiently employ, as vindicating, and not pleading for, the policy and actions of that which was during several years, in spite of non-recognition, for all practical purposes, one of the Powers of the earth. But this necessity, coupled with the effluxion of time, was a restriction which cannot fail seriously to limit the number of those readers in England—of whom we are now exclusively thinking—upon whose intelligent attention Mr. Davis could confidently reckon. His volumes are emphatically addressed, in the first place, to his countrymen, Northern and Southern, many of whom, and chiefly those in the most prominent positions, were actors or sufferers in the terrible war; and, in the second place, to the select, serene, but comparatively limited students of political history everywhere, who will prize such a record for the matter contained in it, as much as for the style in which that matter is worked out. To these, and therefore to the cause of historical research in general, Mr. Jefferson Davis has, in his honoured retirement, with much dignity and simplicity of purpose, offered a contribution of solid value, and for this we tender to him our sincere acknowledgments.

THE FREE LANCES.*

CAPTAIN MAYNE REID seems to be as lively a writer as he ever was, and if *The Free Lances* causes any less thrill of excitement and delight than was wont to be aroused by *The Scalp Hunters* or any other of the books which have delighted

more than one generation of boys, the fact must be due to a change in the reader rather than in the author. Captain Mayne Reid's latest fiction opens (and there is a certain pleasure in finding it so begin) exactly as two or three of his former stories opened, with the sudden appointment of an adventurous young stranger to the captaincy of a band of guerillas. In this particular case the adventurer is an Irishman, by name Florence Kearney, who is discovered reading on the Levee of New Orleans an advertisement for "Volunteers for Texas," which sets forth "the treachery of Santa Anna and the whole Mexican nation, recalling in strong terms the massacre of Fanning, the butchery of Alamo, and other like atrocities; ending in an appeal to all patriots and lovers of freedom to arm, take the field, and fight against the tyrant of Mexico and his myrmidons." Having read it, he exclaims out loud, as the hero of a novel should, "I'll go!" and is answered by a man "who stood full six foot six in a pair of alligator leather boots," and who says, "So ye're goin', air ye?" The hero proceeds to insult him grossly, and of course the giant responds, "I likes yur grit," and then reveals himself as the celebrated Cris Rock, who "at Fanning's massacre war shot dead, and kim alive agin." In the course of the conversation which follows, Cris, learning that Kearney has had some military training, resolves that he is the right man to take command of the Texas volunteers or filibusters. In the next chapter we learn that Kearney is desperately in love with Luisa Valverde, daughter of a refugee Mexican gentleman, who gives Spanish lessons, and that he has a rival named Carlos Santander. It is only to be expected that Santander should also turn out to be a rival candidate for the captaincy of the filibusters, and that after his defeat he should take an early opportunity of insulting Kearney in the presence of Luisa and Don Ignacio Valverde. Here follow three engaging chapters which describe the duel that ensues, and which bring with them a pleasant savour of Marryat, Lever, and of the author's own earlier works. An added charm is found in Captain Mayne Reid's exposition of a theory of fencing which will be entirely novel to most followers of the art. We have first a description of Kearney's drive to the place of meeting, accompanied by his second, Lieutenant Orittenden, and by the devoted Cris Rock, who sits on the box of the carriage, and who has come to see that the fight is all "fair and square." He had formed a bad opinion of Santander and his second; and, "with the usual caution of one accustomed to fighting Indians, he always went armed, and usually with his long 'pea' rifle." There is also a surgeon; and a third person, "no doubt a doctor, too," also accompanies the hostile party when they arrive. To reach the place of meeting they have to leap a ditch, and this feat Santander performed "somewhat awkwardly, dropping down upon the further bank with a ponderous thud. He was a large, heavily-built man—altogether unlike one possessing the activity necessary for a good swordsman." What is to prevent "a large, heavily-built man" from being a good swordsman Captain Mayne Reid does not condescend to tell us; but, as has been before said, his theories as to fencing altogether are peculiar. This is more plainly seen in the following chapter, which describes the actual circumstances of the duel. This begins by the antagonists standing "confronting one another in the position of 'salute,' both hands on high, grasping their swords at hilt and point, the blades held horizontally." At the word "engage" they "both came to 'guard,' with a collision that struck sparks from the steel, proving the hot anger of the adversaries. Had they been cooler, they would have crossed swords quietly." This reminds one of Mr. Burnand's admirable Victor Hugoism, which we quote from memory, in *One and Three*:—"The old man advanced a step. This brought him nearer." But to return to the duellists. "When the instant after they came to *tierce*," which Captain Mayne Reid apparently believes to be the opposite of "guard," they seemed "more collected, their blades for awhile keeping in contact, and gliding around each other as if they had been a single piece." This is a pretty enough beginning, but there is something yet more strange to come in this remarkable duel. Santander, we are told, was an accomplished swordsman; but he had at last met his match, for Kearney possessed a power which, with its effects, will seem more surprising to fencers than even to Captain Mayne Reid—"the power to keep his arm straight," and the author has some excuse, if not for dropping into blank verse, at least for representing this as a possible occurrence, inasmuch as there are various legends of tolerable fencers being baffled by a complete novice whose fencing-master has taught him the only thing that can be taught in one lesson, which is to perplex his adversary by an unusual and not too easily overcome defence. A really fine fencer, however, will find many ways of defeating such a resistance as this, and here we are asked to believe that, while Santander was a first-rate swordsman, Kearney was something more than first-rate, since he puzzled Santander at "his first encounter with an adversary who could keep a *straight arm*." The italics are Captain Mayne Reid's, and serve to show how much he is in love with his utterly preposterous theory. What follows is certainly not less amusing, and may be told in Captain Mayne Reid's own words:—

But Florence Kearney had been taught *tierce* as well as *carte*, and knew how to practise it. For a time he was prevented from trying it by the other's impetuous and incessant thrusting, which kept him continuously at guard, but as the sword-play proceeded, he began to discover the weak points of his antagonist, and, with a well-directed thrust, at length sent his blade through the Creole's outstretched arm, impaling it from wrist to elbow.

* *The Free Lances: a Romance of the Mexican Valley.* By Captain Mayne Reid. 3 vols. London: Remington & Co. 1891.

After this Santander, the admirable fencer who had been baffled by a straight-armed adversary, demands a duel to the death, and when his point becomes entangled in Kearney's braccs, then "first since the fight began, his (Kearney's) elbow was seen to bend. This to obtain room for a thrust sent, to all appearance, home to his adversary's heart." Apart from the gross blunder of drawing back the arm before a lunge, it is too obvious that what Mr. Kearney did at this point was to play upon his adversary the old, and not very creditable, trick known as the *coup de gendarme*, the most primitive form of which is employed by the melodramatic villain, who bids his adversary "observe the flight of yonder bird." Kearney's sword when it touches the other's breast snaps short off, and Santander is in his turn about to try the *coup de gendarme*, when Cris Lock, emulating and surpassing the courier in *A Shabby Genteel Story*, cuts him short with a rifle bullet in the arm, after which it is discovered that Santander has been wearing a shirt of mail which explained "why, when leaping across the water-ditch, he had dropped so heavily upon the further bank. Weighted as he was, no wonder." Santander is unluckily allowed to escape, and we immediately afterwards find Kearney and Cris prisoners in his power in the city of Mexico. In the same city are Don Ignacio and his daughter, and Santander takes an opportunity of securing a mean revenge by ordering some of the prisoners, among them Kearney, to turn out for the loathsome duty of scouring the sewers at a time when he knows Doña Luisa will be by. Santa Anna himself is introduced, and we hear a good deal of his artificial leg and his "wicked passions." But Santander's plot turns to his own discomfiture. Not only has Luisa a lover in prison in the person of Kearney, but also her friend the Countess Almonte's lover, Ruperto Rivas, is imprisoned in the character, which he does not deserve, of a brigand. The two women lay their heads together, and plot a scheme which is in its way ingenious, although the fact of its not being suspected or discovered by the wicked authorities goes to show that villains may sometimes also be singularly credulous and silly. The scene of the escape is, however, not the less exciting; and the subsequent movements of the fugitives, hampered by having to take with them a scoundrelly and malicious dwarf, who happens to be chained to them, will interest all people who have a healthy taste for melodrama.

The first hiding-place of the fugitives is "El Pedregal," a strange locality, which is described as "a field of lava vomited forth from Adjusco itself in long ages past, which, as it cooled, became rent into fissures and honeycombed with cavities of every conceivable shape. Spread over many square miles of surface, it renders this part of the valley almost impassable. No wheeled vehicle can be taken across it, and even the Mexican horse and mule—both sure-footed as goats—get through it with difficulty, and only by one or two known paths. To the pedestrian it is a task; and there are places into which even he cannot penetrate without scaling cliffs and traversing chasms deep and dangerous." This was no doubt a capital place for the escaped prisoners to hide in at first, but it was not enough for all purposes, and they finally had to betake themselves, under the guidance of Rivas, to a mysterious monastery on the top of an almost inaccessible hill, the occupants of which seem, to borrow a phrase from the immortal librettist of modern opera, "to combine the avocation of religious with that of bandit." They are not, however, so much bandits as "Free Lances" in what the readers of the novel are expected to sympathize with as a great and glorious cause, and any irregularities which their leader has committed in appropriating other people's cigars or provisions are as happily accounted for as are the raids of Robin Hood in Peacock's delightful *Maid Marian*. It might be thought that the adventures of the hero and his friends had been striking enough up to their arrival at the mysterious monastery; but Captain Mayne Reid's skill in devising adventures seems to take a new start from this point, and what follows is, if possible, more thrilling than what has gone before. The immediate results of the dwarf's treachery, the manner in which this is counteracted, and the final settlement of everything, we do not propose to relate. To do this would be to discount the pleasure of readers who are still happily capable of being pleased with work which, if highly melodramatic, is at the same time pleasing and harmless. To criticize Captain Mayne Reid's style would be at least superfluous. It may be enough to repeat what we have already hinted, that *The Free Lances* has a not ungrateful savour of such works as, for instance, *La Maison du Pont Notre Dame*, and that any one who has a taste for variations upon the good old themes of Captain Mayne Reid's earlier productions may safely take up his latest production with the certainty of having his old impressions agreeably recalled to him, and of admiring the unflinching liveliness of a veteran and popular author.

PICTURES OF INDIAN LIFE.*

A LARGE portion, if not every one, of these pictures was drawn on the spot. The writer, at the time of composition, had not only his books and a plentiful store of knowledge to

refer to, but a copious supply of official erudition and all the living panorama of social and village life. Macaulay, who while Legal Member of the Supreme Council in India, had never been beyond Barrackpore, has in a well-known passage ascribed to Burke a knowledge of the people and country hardly surpassed by civil and military servants who have passed their lives in Indian Courts and camps. Mr. Cust has evidently seen much more of Hindustan, Upper India, and the Punjab than Burke could ever have imagined, and could have enlightened Macaulay on many other objects besides what that picturesque writer had taken in in his morning drive to Rallygunje and Garden Reach, and what he very cleverly wove into one of his long and polished sentences, as the strange vegetation of the palm and the cocoa-tree, the rice-field and the tank, the huge trees older than the Moghul Empire, the devotees, the maidens, the pitchers, and all the rest of it. Yet even such a practised official as the author of these pictures admits at times that the reality of Indian life becomes less vivid, and that in the matter of this rearrangement and republication it might be desirable, were it possible, to go back to those hot and dusty plains for a few days "to clear up some doubt, to ask some question, to talk to some friend in a language never more to be used." In other departments of literature this want is less felt. However important it may be to a Roman historian to survey with his own eyes the field of Pharsalia, or to compare Livy's description of Hannibal's transit of the Alps with the various Alpine passages which have perplexed critics, modern writers can bring most of the latest discoveries to their own libraries without having to go to foreign lands for them. The research of Germany, the critical spirit of Oxford and Cambridge, the acumen of French Academicians, continue to shed light on disputed classical questions and to remove false impressions about Cicero and Cæsar. All this can be read by the lamp without going to Rome or Naples. With a writer on Indian social characteristics it is somewhat different. Classic India and its modern life are strangely mixed. Some characteristic old proverb has escaped the memory; a story illustrative of some local custom, feeling, or proclivity has lost half its point; the photograph of men, manners, and feelings once vividly impressed on the mind has been dimmed by time; and an Anglo-Indian who every year spent three months in tents, and hardly spoke anything but polished Urdu or the rustic Hindi and Braj Bhakha dialects, longs to listen again to the animated pleading of grey-bearded Mussulmans or Jat cultivators under the spreading trees or at the door of his magisterial tent. Still, it must not be imagined that in this volume we can detect any failing of Oriental knowledge. Rather are we perplexed and overwhelmed with a profusion of material. Then there is an unfortunate similarity in several of the titles, though this was unavoidable; and it is rather an effort to recollect that by the first invader of India is meant, not Mahmud of Ghazni but Alexander the Great; that the Indian Hero is the mythic Itana; that Asoka the Buddhist Monarch represents the Indian King; and that the Indian Reformer is Baba Nanuk, the founder of the Sikh religion. Several of the pictures have been worked up out of incidents within the actual experience of the writer, and one or two, we must say, are rather painful. Death in India records the loss from a fever or tropical complaint of a young civilian of considerable promise; and in Miriam the Indian girl, we have the story of a foundling child which, had it lived, would, like many orphans in the famines of more recent date, have been handed over to the missionaries to be brought up as a Christian. The Indian gallows-tree will recall to many a retired official the calm unflinching determination with which a ruffianly Dacoit or a cold-blooded murderer meets a fate to which, as some great authorities maintain, he feels much less aversion than he does to transportation across the dark water to Singapore or the Andamans. In these and others, the Indian village, the Indian district, the festival, the box of letters, the arrival of the Indian mail at Southampton just after the departure of the outward-bound steamer, there is an intelligent observation, a mastery of Indian detail, a sharp critical touch, an abundant experience, very different from the disjointed scraps and the exploded stories that often form the staple of such works as "Our Year in the Hills," or "Our Six Months' Tour to the Great Cities of the East."

Yet the author ought to admit that there are some odd contrasts in his pages, and that he has recorded some slashing and cutting remarks which his old masters and colleagues would have some hesitation in endorsing. In the preface and again in one of the chapters, we are told about the "good and gentle people of India," and we are encouraged to work for their well-being and to win their love. To one who has set a district in order immediately after the Mutiny there must come recollections of scenes and characters with which goodness and gentleness had nothing to do. Certainly, as a rule, the masses of India are governed by half-a-dozen resolute, just, and practical Englishmen with a success and a completeness to which the annals of conquered races afford no parallel. But no one knows better than Mr. Cust how unexpected some occasion may draw forth all the latent elements of Asiatic devilry and disorder; how every district officer can quote scores of instances where these wild and obedient subjects can compound "all the materials of fury, havoc, and desolation into one black cloud"; and can display, on the least provocation, exquisite cruelty, conscienceless vengeance, and reckless prodigality in sacrificing life for trifling objects. To do Mr. Cust justice, he is at times a severe censor of this inoffensive people, and he does not spare warning, chastisement, and reproof. In two essays, expressly written for the instruction of the natives and translated into the

* *Pictures of Indian Life, sketched with the Pen, from 1852 to 1881.* By Robert Needham Cust, late of Her Majesty's Indian Civil Service, Hon. Secretary to the Royal Asiatic Society, Author of "Modern Languages of the East Indies," and "Oriental and Linguistic Essays." London: Trübner & Co. 1881.

vernacular, the Hindu is taxed with credulity, and the silly stories of the pundits are derided. An elderly village official named Dil Sukh Rai pleads, quite innocently and truthfully, for the retention of such gentle and amiable practices as Suttee, the burial alive of lepers, and female infanticide; all very deeply rooted in the native mind, and no doubt proceeding from "obliquity of vision and moral blindness," but hardly entitling their holders to the appellation of "good and gentle." For gheesed and obese Rajas, corrupt parasites, and impure dancing women the author has no tolerance. They are the scum of Indian politics when the pot boils over. Englishwomen are plainly told that they are not to touch the hands of such reprobates, to "bow down to Rimmon, and to eat food offered to idols," which means, we apprehend, that the wife of the magistrate or the Commissioner is not to see a display of fireworks given by a loyal Raja who has just been made a C.S.I., or to sit down at an entertainment in the English style provided at a house-warming by the millionaire of the locality, who has just built himself a new brick residence, constructed a bathing ghaut, bridged a river, excavated a tank, and repaired a temple. The climax of strong language is perhaps reached when the author analyses a monstrous and bloated Raja, and finds him to be "pure silex of ignorance, the alumen of depravity, the stinking faces of some antediluvian monster." Something of this vehemence we take to be due to the fact that these unwieldy Rajas are often tyrannical, unscrupulous, and extortionate; that they cringe and yet obstruct all reform and progress; and that all strong Indian administrators, from Thomason and Munro to Lawrence and his subordinates, have given the best portion of their active lives to remove the grievances and to secure the agricultural rights of the masses against such tyrants. But, on the other hand, we must not be oblivious of the fidelity and valuable services of Sikh founders and of landholders in Bengal and Behar, during 1857-8, in spite of their predilection for a diet of ghee, curds, and milk, and their infantine delight in that most tedious of public ceremonies, a *durga puja nautch*.

There are several other rather petulant remarks or sweeping conclusions to which a rejoinder could be given. Why are young Englishmen at the deathbed of a companion to be credited with "a hardened heart"? Why should innocent endeavours to amuse society in large cantonments in the plains, where the residents have much to endure, be termed "sickening bustle and hollow gaiety"? and why should no real friendships be formed there, say, at Umballa, Meerut, or Lahore? A cultivated classical scholar who in the midst of district work can turn to the "majestic lines of Homer," or be "lost in the beauties of the Italian poets," is surely guilty of extravagance in turning the Ramayana "the grandest epic in the loftiest and most godlike strains that the world ever knew." Nor are we disposed to consider that remarkable poem, the Bhagavad Gita, as "the grandest effort of unassisted human intellect." This episode of the Mahabharata is a philosophical dialogue between the god Krishna and the hero Arjuna, spoken when the rival armies of the Pandus and the Kurus were drawn up in battle array. Professor Monier Williams has described it ("Indian Wisdom") as imbedded like a pearl in the huge folds of the Mahabharata. It is an attempt to weave the several discordant threads of Hindu philosophy into a consistent plan, with due predominance for the tenets of the Vedanta school, and is marked by great skill of arrangement, and as much perspicuity and beauty of language as this Lucretian subject admits. Indeed, no reader of the "Divine song" can fail to recall analogies to the *De Rerum Naturæ*. But we are hardly prepared to say of either Hindu epic poet or dramatist

Cedite, Romani Scriptores, cedite Græci;
Nescio quid majus nascitur Iliade.

On the whole, we prefer the essays which illustrate the author's familiarity with Eastern languages and his mastery of that region which joins tradition and history, to the recollections of domestic incidents, partings and deaths, Indian scoundrels who are hanged, and unwieldy potentates who seem to deserve hanging. The great Proconsul is a graphic sketch—not of Lord Dalhousie to whom this term was first applied but of Lord Lawrence—and it will, no doubt, commend itself to the biographer in whose hands the materials for the life of that statesman have been placed. His vigour, justice, rapid perception and quick despatch, his native unspoiled by elevation, rewards, or honours, are well and graphically described. But the papers from which the Indian student will learn most are those on Nanuk, on Asoka, on caste, and on the religions of India. For the compilation of the short life of Nanuk, the author, from his long tenure of office in the Punjab, had peculiar facilities. Stories of Nanuk's miraculous gifts are still current; the tree where he lay concealed, the shops where he used to trade, the weights which he used, are still shown; travellers at Hassan Abdul may look on the impression of a hand in marble religiously believed to be his; while of his real goodness, of the purity of his motives, of the excellence of his life, and of the moral effect of his teaching, there can be no question. We must remind Mr. Caut that one anecdote of Nanuk's view of the omnipresence of the Deity has been told in more pointed and pithy terms than he has given. The Sikh Reformer was reproved at Mecca by zealous Mohammedans, for daring to turn his feet towards the Kaaba or sanctuary "where God is." "Turn them if you can," was the immediate answer, "where God is not." We could almost wish that this paper had been followed up by a sketch of the progress of the Sikh religion, and of the change from mildness

and gentleness to the warlike theocracy of Guru Govind and Har Govind, though doubtless some of this is available in Cunningham's *History of the Sikhs*. The essay on Asoka, though only twelve pages in length, summarizes very happily the conclusions at which a race of scholars has arrived regarding the edicts of this mighty monarch. Pillars and stone slabs have been compelled to reveal their contents; and if we may search in vain for evidence to show how India relapsed into idolatry, revived caste, and drove away the reformers to Ceylon and Burmah, we have abundant proof of the simplicity and excellence of the Buddhist Code as propagated by its most powerful secular supporter. Animals were not to be eaten as food, nor offered as sacrifice; wells were to be dug, and trees planted by the sides of roads; men and animals were to be tended in illness; and missionaries were to be sent into divers countries to convert the people. The appointment of informers and of public guardians may be questionable in practice, but this idea is deeply fixed in the Asiatic mind. Later on the Mohammedan sovereign had his *mohataib*, who was both adile and consor, examined weights, and put down gambling and intemperance; and the late Yakub Dey Khushbagi of Yarkand and Kashgar appointed men who sent the faithful or faithless to prayers by the strokes of a whip. Equality of rank, uniformity of religion, and a preference for virtue over carnal pleasures and mundane glory, are features of which every religion or reformer may be proud.

The essay on caste, which is styled "the great Indian custom," will probably strike some Anglo-Indians as taking too favourable a view of the working of a social code more elastic and yet more durable than laws and enactments graven on pillars and walls. We agree in a good deal that is argued about the uses of caste. It favours cleanliness, preserves purity of birth and descent, and has never, either in our own or we may say in any previous régime, prevented men of real capacity from rising to public eminence. It does not engender a state of social dissatisfaction, but the reverse; a low-caste man, a Chamar or a Dosadh, thinking as much of his rights and privileges as a Mir, a Mukarji, or a Kashmirian Brahman. Then caste has wonderfully adapted itself to the wants of society. Though men may not eat and drink together, nor intermarry, nor smoke with other castes, yet Brahmans and Sudras can drink at the same tank, wash at the same bathing place, and purchase rice, pulse, and sweetmeats at the same shop. Long ago Manu laid it down that the hand of a shop-keeper was pure to all. It is no bar to associations for good or evil. Natives have been partners in great commercial houses with Englishmen; Hindus and Mohammedans can join a landholders' association in Oudh or Bengal. Riyots have formed a very mild sort of Land League for the protection of their several rights and properties; and bands of Dacoits have found it politic to enlist a Brahman or two in their troop, on the ostensible ground that his presence impairs the keen vision of police officials, and throws an air of respectability over dark enterprises. But there is a bad side to caste of which too little account is taken in this essay. Boatmen able to swim like ducks will look on heedlessly while a fellow-creature is drowning; no one stirs hand or foot while the house of a neighbour is in flames. "He is of a different caste" is heard every day as an unanswerable argument why a man should not be helped in a difficulty or warned of a danger. Caste meets the philanthropist and the statesman as an obstacle to the most reasonable alterations, and no one with such experience as the author will deny that it deadens the sympathies, warps the intellect, and narrows the heart. The paper on caste is followed by two papers full of information as to the non-Arian tribes, the religions of India, and the condition of Indian women. We are told that in legal language the three most prolific sources of litigation are chattels, women, and lands. We wish that the author had given us his version of the native couplet to this effect, which in some parts of India runs as follows:—

Zan [woman], Zamin [land], Zar [gold],
Tinnu kazyali ka ghar.

The last line means that these three are the "house of quarrel." We may say, in conclusion, that though we find no offensive or injudicious comparison between the new race of civilians and that older generation which saw the extension of our Empire and the death of the East India Company, it will be well if those who are now governing Hoshiarpore, Banda, Benares, and Lahore will try to combine the scholarship of the author with his sense of duty and his unquestionable regard for the people.

THE POLICE OF PARIS.*

THE Paris police has long been considered the most perfect organization of the kind in existence; and the chief of the detective branch of the service is regarded as a being of almost preternatural sagacity, wielding an all-seeing and far-reaching power. Gaboriau's hero, M. Lecoq, is the portrait of a typical functionary of this class. When a mysterious crime has been committed, the slightest indication is sufficient to set him on the right scent; he performs marvels of induction in following it up; and his untiring patience enables him to unravel the most intricate plots, and bring the real delinquent to justice. When it

* *Mémoires de M. Claude, Chef de la Police de Sécurité*. 2 vols. Paris: Jules Rouff. 1881.

was announced that the memoirs of M. Claude, Chef de la Police de Sûreté, were about to be published, everybody expected revelations which would throw the ingenious stories of the great criminal novel-writer into the shade. In a certain sense these expectations have been realized, for M. Claude's revelations are of a most startling character; but they by no means confirm the view, to which we have referred, of the efficacy of the Paris Secret Police as an organization for the repression and discovery of crime; nor do they give a very exalted idea of the ingenuity of the chief himself. M. Claude was, indeed, in the opinion of those qualified to speak with authority, not only a very clever detective, but the actual original of the portrait of M. Lecoq. Yet, no doubt from natural modesty, he represents himself in his memoirs as an amiable, conscientious, official, struggling to perform his duty under difficulties, and generally owing his great *coups*, when he made any, either to accident or to information derived from the spies of another agency than his own. But what we do learn from him is the frightful corruption of society and dishonesty of the governing classes under the Second Empire. There can be little doubt that M. Claude has taken for history some of the numerous *canards* invented by the anti-Bonapartist factions; but there is enough left, after making every allowance for error and scandal, to form a crushing indictment against Napoleon III. and his *entourage*. The reign of Louis Philippe, under whom he served as Commissioner of Police, was corrupt enough, and society was even then undermined by disloyalty and immorality; but it was a perfect Arcadia in comparison with the picture which M. Claude gives us of Paris under the Empire. The fall of the Citizen King was heralded by a vulgar crime in high life, the brutal murder of the Duchesse de Praslin by her husband, which, though it had no immediate connexion with State affairs, sufficed to excite the populace, and led indirectly to the Revolution. Amongst the anecdotes of this period related in the Memoirs is the ridiculous incident of Raspail, the demagogue, who was decorated in spite of himself. Louis Philippe, believing the cross of the Legion of Honour to be a sovereign remedy against disaffection, ordered this distinction to be offered to the dangerous Radical; but the latter, after a long struggle with the authorities, who insisted upon gazetting and congratulating him, refused the proffered honour, and was imprisoned for his pains. M. Claude hints that, like many another demagogue, Raspail would have vainly accepted the ribbon, but dared not do so.

En effet, des chefs des sociétés secrètes comme Raspail ne s'appartiennent pas. Au nom de l'indépendance, ils sont les hommes les plus dépendants du monde. Ils obéissent, en dehors de la société légale, à une consigne inflexible. Ils rassemblent à ces gens qui, après avoir rompu les liens de mariage, deviennent l'esclave d'une maîtresse ombreuse, dont les liens sont bien plus puissants que ceux qui les attachent à leur épouse légitime.

To understand M. Claude's book, and, indeed, any of the romances which turn upon criminal trials in France, it is necessary to know something of the procedure, which differs very considerably from our own. Each district in Paris has a commissary of police, whose duty it is, on a crime or death being reported, to proceed to the spot and open a preliminary investigation, at which he is assisted, when necessary, by the police de Sûreté. A plaint deposed, either personally or by letter, will be investigated by the same officer. The commissaire can summarily arrest any suspected person, who is then lodged at the Conciergerie, or central dépôt for prisoners. He also frequently pays "domiciliary visits" to the house of the accused, overhauling and taking possession of all his private papers. If, on examination of the accused and of the witnesses, there appears to be a *prima facie* case against the former, the commissaire passes him over to a "judge of instruction," who henceforth has entire charge of the case. The accused is then sent to Mazas, the House of Detention for the capital, unless the juge d'instruction chooses to admit him to bail, in which case the amount fixed must be actually deposited with the Court. If the juge sees fit, he may confine the defendant *au secret*, though this is only done in extreme and difficult cases, and a prisoner *sous précaution*—that is, before committal—is generally allowed to communicate with his friends. The juge d'instruction now proceeds thoroughly to investigate the case, personally cross-examining the prisoner in his office, confronting him with some witnesses, examining others in private, and using every available means for either proving or disproving the charge. The prisoner may be sent for at any time to be questioned on some fresh evidence that may have come up, and is interrogated on any subject connected with his past career which the magistrate thinks likely to throw light upon the circumstances under investigation. He is also carefully watched in his cell, and his words and the notes sent to or received from his friends may be all used as evidence against him. The "prevention" may, and often does, last for months; but when the juge d'instruction can carry the case no further, he either issues a certificate of *non-lieu*, in which event the accused is free, or he makes a report to the Procureur de la République committing the prisoner for trial. The procureur determines, in accordance with the terms of the Code, in which court the trial shall take place, either at the Police Correctionnelle before a bench of magistrates, or in one of the courts of assize or appeal before one or more judges and a jury. At the trial the depositions taken by the judge of instruction are considered as evidence, and are read before the court, only the principal witnesses being called; the prisoner himself undergoes a searching personal examination in public. When the procureur has committed the prisoner for trial, and not before, the advocate

for the defence is allowed access to the depositions, and frequently learns for the first time the real nature of the indictment. This procedure appears at first sight to entail some hardship upon the accused, but it has its advantages also; he is enabled, for instance, to explain many things which would otherwise tell against him, and if evidence is received which we should consider somewhat irrelevant, as much may be in his favour as against it. The complete secrecy of the preliminary investigation before the judge of instruction is also obviously advantageous in the case of an *ordonnance de non-lieu*.

M. Claude tells the story of the *Coup d'état*, which is already well known enough, but he gives us personal information about the chief actors, which is for the most part new, and which sets them forth in a meaner and more disgraceful light than even M. Victor Hugo's fierce invective has done. The circumstances under which M. Claude first encountered Prince Louis, afterwards Napoleon III., are sufficiently romantic. A young and pretty grisette attracted the attention of the gallant police officer, and gave him a rendezvous at the Cabaret du Lapin Blanc, celebrated later on by Eugène Sue, and known at the time as the haunt of the worst desperadoes in Paris. Here his siren, transformed into a fury, denounced him to her companions; he was at once set upon and overpowered, and would have infallibly been murdered but for the intervention of two persons dressed as workmen, who arrived opportunely on the scene, and authoritatively commanded the bandits to desist. One of these proved to be an old patron and protector of M. Claude's, an avowed Bonapartist; the other was Prince Louis himself, who was combining a political propaganda amongst the lower orders with an intrigue with the too seductive grisette. The author vouches for the authenticity of the incident, and moreover declares that the adventures of Eugène Sue's Prince Rudolphe in the *Mysteries of Paris* are a more or less accurate account of Prince Louis's escapades.

The first care of the conqueror of France, after the *Coup d'état*, was to hand her over to the police. At this period the police were everything and everywhere; they were to be found in the army, the press, the middle classes, and from the highest to the lowest grades of Parisian society. They formed an invisible but unbroken chain, which extended from the most sordid dens to the salons of the Tuileries. The Chambre Noire, a secret tribunal which had been suppressed under the previous reign, was once more installed at the Palace, and, according to M. Claude,

Il n'était pas rare d'y voir figurer le souverain lui-même en tête-à-tête avec les *Alexandre* ou les *Romain*, des Corses attachés à sa personne, quand ces gardes du corps, armés jusqu'aux dents, avaient à prévenir sa majesté qu'un nouvel Italien dépeché de Londres ou de Naples était dépeché pour attenter à sa vie.

At the Prefecture of Police, then under the charge of Lagrange, were twenty-six thousand *desriers* of persons suspected of being, or known to be, enemies of the Empire, and it was Lagrange's duty to lay these before the Emperor and the Chambre Noire as occasion required. By his means Louis Napoleon became a spy on his subjects, and through the secret tribunal the Tuileries became a mere *annexe* of the Prefecture. Lagrange worked entirely through spies, who were selected from all ranks of society.

One of these, a Mme. X., plays a very important part in the Memoirs, and some of the anecdotes related of her form, if true, a curious appendix to already written history. This person, who was devoted to the Empire, entertained a grateful regard for M. Claude, who had saved her life on two occasions; and, although she knew him to be a very lukewarm Bonapartist, supplied him from time to time with information which aided him considerably in his criminal investigations. The first of the occasions on which he rescued her was strange enough, and led to remarkable results. She was found by one of his agents at midnight lying insensible, from the effects of a strong narcotic, in a half-finished building, stripped, and otherwise maltreated. M. Claude, having seen that she received proper attention, applied himself to discover the authors of the outrage, and presently traced them to a neighbouring tavern, proving, at the same time, that two men had been concerned in it, one of them being a lieutenant of an infantry regiment. The manner in which he accomplished this was worthy of M. Lecoq himself, to whose method of conducting the inquest in Gaboriau's well-known novel of that name it bears a striking resemblance. It is one of the few genuine detective stories in the book, and is well worth reading. The sequel, however, is more interesting still. Mme. X. had formed a *liaison* with a certain young officer, and had also a friend, an Italian Princess, who, like herself, was a spy in the pay of the Emperor. The last-mentioned personage was, however, secretly allied to the Mazzinian party. She told Mme. X. that her lover was in correspondence with one Pieri, an agent of Mazzini's, with the object of overthrowing the Empire, and advised her friend to make this man's acquaintance, find out the whole particulars of the conspiracy, and then denounce the conspirators. This advice Mme. X. followed, while the Macchiavellian Princess put the other two upon their guard. Pieri and the lieutenant resolved upon punishing the intending traitress; the former invited her to a *tête-à-tête* dinner, drugged her, and, with the assistance of the lieutenant, who had kept in the background, perpetrated the outrage which M. Claude discovered. Mme. X. took a fearful vengeance; the young officer was denounced and poisoned when in prison by his former mistress, the authorities taking no notice of such a trifling eccentricity on the part of one of their allies! Pieri was the subsequent accomplice of Orsini, and the failure of their attempt to assassinate the Emperor, and

the execution of Pieri himself, whom the authorities were inclined to reprieve, are attributed by M. Claude to the vengeance of the insulted spy. Mme. X. figures also in another of M. Claude's dramas, in which Napoleon himself is the principal figure.

The non-political crimes with which M. Claude had to deal are quite as dramatic and interesting as any in the pages of fiction; but the accounts which he gives of them seem to show more the terrible immorality of all classes of society under the Empire than the ingenuity of the police in tracing the criminals. M. Claude's work is scarcely a book for family reading, and most of the stories contain incidents distasteful to the English readers. For this reason we cannot do more than briefly refer to them, although they are generally of great dramatic interest, and, when politics do not come in, are obviously founded at least on actual fact. The story of La Pommerais, the physician, who was executed for the murder of his mother-in-law and of a former mistress, by poison, is told at great length, and brings us, like most of the great crimes of the period, into connexion with the fraternity of titled swindlers, chiefly Spanish, who formed the *entourage* of the Emperor.

After the revelations of political and social corruption, and the sickening details of brutal crimes and disgraceful intrigues, with which the work familiarises us, it is refreshing to come across a humorous and comparatively harmless incident. M. Claude, being on the track of an escaped convict, had sought him out, and found him at the Bal Bullier, or Closerie des Lilas, as it is also called, and was on the point of arresting him, when the criminal whispered a few words to some of the women who were standing near him.

Il n'a pas achevé de prononcer un mot à voix basse que je ne peux plus avancer. Toutes les filles qui l'entouraient s'avancent fiévreusement au-devant de moi; elles forment une barrière infranchissable derrière laquelle mon escroc m'échappe, avant que je puisse dire un mot pour requérir la force armée.

Aussitôt tout un essaim de beautés me presse, me cerne, m'enveloppe en criant:—C'est Béranger! . . . c'est Béranger!

The runaway had given the word, the Chief of the Police de Sûreté was taken for the poet of the people, and fêted accordingly against his will. His bald head and amiable patriarchal countenance aided the delusion; remonstrance was useless; and he was obliged to tear himself as best he could from the effusive demonstrations of his mistaken admirers, while the convict once more made good his escape, and was heard of no more.

In addition to his dramas and romances, M. Claude furnishes some interesting information concerning the criminal classes of Paris, and the constitution of the prisons of the capital, which will be new to most readers. He has also much to say about card-sharps and other gambling swindlers; but, though very readable, this part of his work cannot compare with the exposures of Robert Houdin and Cavaignac, the evil geni of the "Grecs." The third volume, which is shortly to appear, will contain the whole story of the notorious affair of Troppman, the Alsacien who murdered a whole family, and suffered for his crime upon the scaffold. Throughout the Memoirs M. Claude speaks in a mysterious manner of this incident, which he says was the prelude to the fall of the Empire. His suggestion apparently is that Louis Napoleon was secretly in accord with Germany to cede Alsace and Lorraine to that Power, in exchange for quiet possession of Nice and Savoy, and that persons who had in any way an inconvenient knowledge of this arrangement were disposed of at the direct instigation of the Tuileries. On one occasion the President of the Cour Impériale was assassinated in a railway-carriage; and M. Claude, though on the track of the assassin, was compelled to desist, and write at the bottom of the depositions in the case "Rien à faire!" The Troppman incident is the second occasion, and we shall watch with interest M. Claude's exposition of what certainly seems an improbable theory. "Shady" as the organization of the Paris police was under the Empire, it would appear to compare favourably with the police of to-day. A recent article in *Le Figaro* gives a picture of unrestrained ruffianism and vice, to which the streets of even that much-suffering capital were hitherto strangers. Like everything else in France, this is attributed to the influence of party politics, the extreme Radicals being accused of a disinclination to offend any person whatever who may have a vote, while the same distrust exists between the various departments and the Government as in the time of the Empire. The *Figaro* says:—

Nous vivons à Paris dans une perpétuelle féerie qu'on pourrait intituler: *Le monde à l'envers*. Pour ne citer qu'un exemple, c'est la Préfecture qui est sous la surveillance de la haute police. M. Andrieux est *fié* par le Conseil Municipal et les sergents de ville sont arrêtés par les "souteneurs."

After all, we need not, perhaps, envy our neighbours their much-vaunted police; our own, as we had recently occasion to point out, is sadly in need of reform, but the materials of which it is composed are certainly more promising.

HISTORY OF THE KHALIFS.*

ORIENTALISTS have long been familiar with Suyûti's *History of the Khalifs* through Colonel Nassau Lee's text, printed at Calcutta in 1857; but Major Jarrett has done good service in

* *History of the Caliphs*. By Jelâ'u'ddîn as Suyûti. Translated from the Original Arabic by Major H. S. Jarrett, Secretary and Member of the Board of Examiners, Fort William; Fellow of the Calcutta University. Calcutta: published by the Asiatic Society. 1881.

translating it, and thus bringing its many points of interest within the reach of the unlearned. Suyûti is a remarkable figure in Oriental literature, and forms the exception to many rules. No one comes more accurately under the definition of a man of letters, for Suyûti's sole occupation was writing, and his subjects were coextensive with the learning and culture of his age. He wrote more than two hundred works on tradition, thirty-five on the Koran, ninety on jurisprudence, thirty-three on history and biography, sixty-three on philology, and seventy-six on general literature. Some of his writings were no longer than this article, and among these shorter theses some were trivial and others merely *tours de force* thrown off in a given time. But with all this fluency and discursiveness, Suyûti produced several monumental works. Nöldeke, in his *History of the Koran*, signalises the wonderful learning of Suyûti, his sound judgment, and his sincere love of truth; and it is Suyûti's *Ithân* that must stand in the front rank of Arabic criticism on the Koran. He is also one of the two authors known as the "Jelâleyn," whose commentary on the Koran was used by Lane and by Professor Palmer. His *History of Egypt* ("Huan el Mohadarnh") is a charming book and ought to find a translator, whilst his *Nuzhet* is invaluable as an authority on manners and customs. Many others of his works are scarcely less important than these, and, as a whole, his literary productiveness was not attended by the common drawback of shallowness. Although he was largely a compiler and popularizer of other men's researches, he was not less a *Gelehrter* himself, as was clearly recognized by the greatness of his time, who appointed him to various professorial offices of the highest influence. His colleagues in letters, however, did not hold him universally in honour; and the biography quoted by Major Jarrett, written by a contemporary traditionalist, is as petty a specimen of authors' spite as we have seen. There may be truth in some of the charges of plagiarism advanced against Suyûti; but if he stole, at least he stole to good purpose, and only stole the very best article. We are not sure as much can be said for all plagiaries. But most of Sakbâwi's abuse is nothing but envy and black bile, and may be dismissed without discussion. The mere fact that Suyûti and his fellow-writers fall out only brings him nearer to the sympathies of the modern man of letters.

Suyûti's own account of himself is as extravagantly laudatory as his rival's is contemptuous. To judge from his own words, there never was so remarkable a man before or since. "I acquired a profound knowledge," says this autobiographer, "of the seven sciences of exegesis, tradition, jurisprudence, grammar, and the three branches of rhetoric. . . . What I am conscious of is this, that the proficiency I attained in these six sciences (omitting jurisprudence), and the writings thereon which I perused, none of my Shaykhs ever reached thereto nor were there-with acquainted; still less those inferior to them." He then admits that of other subjects he knows rather less, and adds that nothing he says is said in vain-glory, but simply "in acknowledgment of the favour of God," who alone accomplishes these wonders. The only practical information to be gleaned from the autobiographical notice consists in the names of his teachers and the character of his studies. If to this we add that he was called Suyûti (or Usyûti), from Suyût (now commonly written Asyût or Siout), in Upper Egypt, where he was born in 1445; that his other names were Abul-Fadl Jelâl-ed-din Abd-er-Rahmân, and that he died in 1497, we have very nearly all that is known of Suyûti outside his works.

The *History of the Khalifs* is not the most important of Suyûti's writings, but it is more generally interesting than the rest, always excepting his *Agreeable Colloquy on Egypt*. The tendency of Eastern historiography was from the greater to the less. The highest authorities on the annals of the Khalifs, Tabari and Ibn-al-Athir, were long dead; the delightful storyteller Mas'ûdi, the author of the *Meadows of Gold*, had become a remote memory; even the noble robber of books, Abul-Fida, was gone; and the Oriental world of letters was engaged in epitomizing and collating the results of these departed luminaries. The age of classics was over, and the day of primers had arrived. Everybody tried to boil down the work of his predecessors. But Suyûti was not merely an epitomist, he was also a collector. He used a dozen or more high authorities, and took from them whatever he thought interesting. His work is therefore rather a cento of the good things of many writers than an abridgment of one history. It must be admitted, however, that it is far too brief for any approach to thoroughness, and that the author's principle of selection is a curious one. Of course one does not expect a philosophical history from an Oriental, at least from a Mohammedan; there is no such work in existence by a Moslem author. A total want of method, indifference to the relation of cause and effect, an almost universal lack of what is called the historical spirit, are among the failings of Mohammedan writers. Their works are not histories in the modern sense, but a mixture of annals and curiosities of history, the former predominating in some instances, such as Ibn-al-Athir's *Kamil*; whilst Suyûti's *History of the Khalifs* is a good instance of the latter kind. It is, in fact, a collection of good stories, interspersed with many curious facts which throw a vivid light on the condition of the people. If we expect anything more than this, we shall be disappointed. We shall not find any explanation of how it was that the Khalifs managed to keep their hold over their vast empire for so long a period; we shall not be able to trace from Suyûti's notes the rise and fall of vassal-dynasties, or the causes which led to the final

overthrow of the Khalifate; we shall not even discover a connected outline of Arabian literature during the period. All this was not in the mind of the Mohammedan historian. But we shall see many side lights thrown on the larger issues, we can gather much valuable material for the filling up of the great picture, and we shall gain a very fair insight into the way in which life went on at the Courts of the Khalifs at Damascus and Baghdad.

As a literary man, Suyûti gives exaggerated prominence to the literary side of his subject, and his book is full of those anecdotes of poets and their royal patrons which Mr. Palmer has of late so successfully introduced to English readers. But it is a fact that literature formed a very important part of the Khalifs' occupations. Very few of them omitted to try their hands at versifying, and if the subjects were not very original or the thought very profound, at least the prosody was passable, and sometimes really excellent. We have a large collection of poems composed by Khalifs in Suyûti's history, and they certainly throw a flood of light on the character of these spiritual lords of Islâm. Reclining on a bed of narcissus flowers under the full moon, drinking the red wine, and elaborating an ode to a black or white slave, seems to have been the every-day work of most of the Khalifs. Mahdi, the third Abbasside Khalif, thus sums up the ideal life of the Mohammedan pontiff:—

O God! perfect unto me my joy
Through Abu Haf's my comrade:
For the pleasure of my life
Is in song and wine,
And perturbed slave girls,
And music and enjoyment.

It is true that of one Khalif it is recorded that he "needed no boon companion save the Koran"; and there really was one ascetic among the thirty-seven Abbassides who actually fasted and wore hair shirts, and otherwise emulated the good deeds of the corresponding paragon among the Ommiades, the pious Omar ibn Abd-el-Aziz. But as a rule it must be admitted that the Khalifs were a reckless devil-may-care set of rakes, who scrupled at nothing to serve their appetites, and put themselves to no pains to serve anything or anybody else. Yet Suyûti generally sums up their characters in an agreeable manner, perhaps with a touch of sarcasm, as in the label with which he docketed El-Musta'in: "He was virtuous, of distinguished merit, accomplished, and eloquent, and he was the first who set the fashion of wearing loose sleeves, for he made their breadth about three spans, and he diminished the height of the caps, which were excessively tall before his time." The details recorded by Suyûti on this matter of dress and ceremony are very curious. We are told that El-Mo'tezz was the first Khalif who rode about with gold ornaments; silver had before been the fashion. Er-Radi was the last Khalif who sat in company with boon companions and went journeying in garments like those of his predecessors, and conducted his expenses according to the *ancien régime*. Certainly these expenses were considerable, and money was not spared in the pomps of State ceremonial. When Mamûn married Buran, her trousseau, which cost many thousands, was the least of her father's expenses; for this princely man presented every officer of State with a robe of honour, and then, writing the names of his various country estates on slips of paper, scattered these broadcast among the guests, and whoever picked one up became owner of the estate named thereon. These nuptials cost more than a million of money; the bride's mother's present to the bridegroom was a string of a thousand pearls, and the happy pair were illumined by a candle of pure ambergris weighing eighty pounds, set in a gold candlestick. When another Khalif married Dowdrop, the daughter of Khumarawayh, Governor of Egypt, the lady's dowry included four thousand jewelled waistbands and a thousand gold mortars for pounding perfumes! These treasures, it is true, were not among the expenses, but the replenishments, of the Khalifs' exchequer; but they came in only to go out again. Apart from ordinary extravagance—such as spending 500*l.* a day on his dinner—a Khalif loved spending in a Christian fashion—hoping for nothing in return. For example, El-Mo'tasim built a magnificent palace; the Court poet wrote some dedicatory lines in its honour; these lines began with a reference which was considered ill-omened; so the Khalif pulled down his new palace and enjoyed the luxury of paying heavily for nothing. The general spirit of heedless *laissez-faire* which characterized the conduct of these Khalifs is fairly illustrated by the response which one of them—El-Amin—made to the messenger who brought to him at the river's bank the tidings that Mamûn had usurped the throne. "Confound you! Leave me alone! Kauthar has taken two fish, and I have not taken anything yet!"

Some of those curiously shrewd stories which run through all Arab history centre round this usurping brother Mamûn, who was in strong contrast to most of the Abbassides in character and conduct. He was a man of penetrating intellect and sound judgment, a friend of philosophers and jurists, and a patron of the new translations from Greek authors. A good deal of his fine qualities may perhaps be attributed to his mother, who was a Persian slave. At that early period of the dynasty the bondwoman's son apparently suffered the scorn of the free wife, as the relations of Amin and Mamûn indicate; but soon the inferiority of such offspring ceased to be apparent. It is a noteworthy fact that all the Abbasside Khalifs, except three, were the sons of slave-girls—Persian, Berber, Turkish, Nubian, Greek, or of other nations. There must have been very little

of the noble Hashimite blood of Mecca in the later Khalifs; and even in Mamûn's case, early as he was in the long series, the mixture of blood probably gave him something of his intellectual pre-eminence. Yet, with all his wisdom, he was as apt to be taken in by a clever retort as was his father Haroun. A man was once brought before Mamûn charged with a crime. The Khalif swore, "By Allah, I will slay thee!" The prisoner replied, "O Prince of the Faithful, act gently in regard to me, for compassion is the half of mercy." "How can I," said Mamûn, "now that I have sworn to slay thee?" He answered, "It is better to meet God as a perjurer than to meet Him as a slayer." So the Khalif overlooked the fallacy, and let the man go his way. Mamûn once related the most embarrassing pleading that had ever been made to him. It was "the answer of a man of Kufah, whom its inhabitants sent to me, and he complained against their Governor. I replied, 'Thou liest, for he is a just man.' He said, 'The Prince of the Faithful hath spoken truly, and I have lied; verily thou hast specially chosen him for us in this city, to the exclusion of other cities; now, therefore, appoint him to another city, that he may encompass them with his equity and justice, as he hath encompassed us.' I said, 'Kiso, and be off; verily I shall remove him from over you.'"

The love of a practical joke is a prevailing characteristic with the Khalifs. Even after El-Kâhir was blinded and deposed, he could not help enjoying a trick at the expense of his successor, Er-Râdi. The latter knew that El-Kâhir had accumulated, *more majorum*, a fine collection of confiscated treasure, and he tortured him in vain to find out where it was hidden. At last he spoke him fair, and El-Kâhir, yielding to kindness, acknowledged that it was buried in the garden. Now this garden was exquisitely laid out and planted with rare trees and flowers, and Er-Râdi was much attached to it. Nevertheless, he resolved to find the buried treasure, even if it lay under the choicest pasture. "I am blind and cannot guide thee," said El-Kâhir, "but dig up the garden and thou wilt find it." So Er-Râdi pulled down the pavilion, and uprooted the trees, and made havoc of the garden, without result. It was only El-Kâhir's little joke; he could not see and enjoy the garden himself, and he did not care for any one else to do so.

A very curious part of Suyûti's history is the account of portents and wonderful storms and floods which is attached to almost every reign. We read that "in the year (A.H.) 240, the people of Khelât heard a loud shriek from the vault of heaven, and a large number of people died therefrom, and hail fell in Irak like hen's eggs, and thirteen villages were swallowed up in the earth in Mesopotamia." "In the year 241 there was a commotion of the stars in the heavens, and the heavenly bodies were falling the greater part of the night like locusts." In 242 there was a great earthquake at Tunis and Khorasan, &c.; the earth opened to an extent that would have admitted a man into the cleft. The village of Suwayda, on the confines of Egypt, was stoned from heaven, and one of the stones weighed ten pounds. A mountain moved in Yemen; and at Aleppo a white bird came down during Ramadan, and cried forty times "O ye people, fear the Lord, the Lord, the Lord," and five hundred men heard this and testified to it. In 284 a great redness appeared in Egypt, and men's faces and the walls of houses appeared quite red, and the people supplicated God. In 285 a yellow storm blew over Basrah, and turned green, and then black. It was followed by hail of immense weight; trees were uprooted; and black and white stones rained down. In 304, Baghdad was in consternation concerning a beast called Zazbab, which roamed at night on the flat roofs, and ate children and committed other atrocities. In 323 "the stars kept falling all night with extraordinary frequency." In 328 "Baghdad was swamped by a terrible inundation, so that the rise of the water reached nineteen cubits, and men and animals were drowned and houses destroyed." And so on through a long record of calamities, famines, floods, and celestial perturbations.

We have said enough, however, to show how interesting and curious a book this is of Suyûti's, and what good service Major Jarrett has done in bringing it within the reach of English people. His translation is well done and pleasant reading. Without being pedantically literal, it is accurate and scholarlike. The chief fault we find is a very little one; the punctuation is erratic and perplexing, especially in the foot-notes. Such a reference as "Consult. Ramsay's art, on Livy in William Smith. Cl. D." is confusing to the mind, and is rather after the rule than an exception. Major Jarrett is also rather shaky over proper names—e.g. Kultumish should be Kutalmish; Râi, Jâyy; Kilâwun, Kalâun; Istakhari, Istakhri; Sarkhas, Sarakhs; Mosal, Mosil; whilst Tiberius is an unusual translation of Tabariyeh, just as "corchorosa olitorius" would have astonished Linnæus as the scientific name of Jews' mallow or malûkhiyeh. "Mim," too, when it does not stand for Egypt, means its capital as a whole, not any particular quarter of Cairo, unless specially qualified by the context, and Major Jarrett is wrong in rendering it "Old Cairo," and would still have been wrong if he had used the more proper expression Fustât. There are also a large number of misprints in English words, which a more careful reading of the proof-sheets would have eliminated. This is, however, not much to complain of, and Major Jarrett's *History of the Caliphs* ought to find many readers and please them well.

CERAMICS.*

THERE is no English Brougriart, and many as are the books on pottery and porcelain, a complete and practical work has yet to be written. The books so far published are generally either of the drawing-room-table class, pretty and nothing more, or of the purely technical class, in which beauty is ignored. There is indeed a third class, very characteristic of our age and generation—the advertising book, magnificently illustrated, and containing biographical notices of every shopkeeper who retails china, and every potter who makes it. The work of Mr. Janvier before us does not come exactly under any of these denominations. It is very practical, bristles with technical terms, and goes fully into bodies, pastes, and glazes. But it also goes into the antiquarian and the artistic aspects of the subject, and altogether strikes the reader as a very complete, modest, and handy book, in which nothing of importance is omitted and little room wasted. Although there is not a word or a hint given in the preface that the author is an American, it is evident on nearly every page; and we have another proof to add to the many now before us that the Americans are awakening in a remarkable way to the sweet influences of art. American artists will soon distance ours, unless we apply ourselves with the same diligence to learn the best methods of working. The haphazard school which exists chiefly in England, where every painter, every modeller has his own method, will have little chance when the best system is sought for carefully and carefully taught. Mr. Janvier's book would be more instructive if it contained the illustrations to which reference is occasionally made in the text, and which we presume are only to be found in the American edition. There are other signs of careless editing; but whether to be charged against the English or the American correctors of the press it is not possible to say. The name of the great French author, on whose work, indeed, Mr. Janvier's is based, may be found spelled in a variety of ways; and such expressions as "in this country," when American, not England, is meant should have been either altered or explained in an English edition. If the book contained a sufficient number of good pictures, it would stand almost alone among modern works on ceramics; for it is neither to be classed as only a table book, nor yet as a merely technical book. If amateurs want to learn the art, it is very possible Mr. Janvier may be able to teach them—very possible, we say, because it must remain matter of very considerable doubt, prior to experience, whether any art can be learnt by reading alone, without practical demonstration.

Mr. Janvier begins with a short sketch of the history of pottery and porcelain. Like most writers on art, he stumbles a little over early Egypt, especially in trying to give a date to the period of the pyramid-builders. It is likely enough that no investigations will ever solve the problem of Egyptian chronology, but in a book of this kind it would be quite enough to say that at the unknown period of the ancient or pyramid-building monarchy, ceramic art was known and practised, like many other arts, with a success seldom surpassed since. The chronological history of Egypt begins about 2000 B.C., and Mr. Janvier is certainly wrong in giving either Babylonia or China the precedence in ceramics. He speaks of representations in the caves at Beni Hassan of potters at work. These he places at about four thousand years ago. We do not know, with any certainty, the age of the Beni Hassan caves. Mr. Janvier's date, 2100 B.C., is not an improbable one; but Mr. Janvier is evidently not aware that, at a period which cannot be made less than one thousand years before Beni Hassan, potters were in full work, and pottery was both represented in numberless sculptures, and has also come down to us in countless examples. The pyramids of Abou Rowash, which may very well date from the so-called second dynasty of Manetho, are surrounded by heaps of the broken vessels which perhaps five thousand years ago, and certainly not much less, contained the funeral baked meats of some dead Pharaoh. Besides this, the pottery made at Thing Thao in China, in 2255 B.C., is modern. Scarabs made of earthenware, finely glazed with a turquoise colour, and bearing the names of such old kings as Cheops, Chephren, and others of the pyramid-building dynasties, are not at all uncommon. Mr. Janvier mentions a very early method of coating or enamelling upon stæatite, and also the use in a similar way of natural sandstone, but it is a question whether he is correct in saying the Egyptians "made no true porcelain." It is not very easy to distinguish opaque coloured glass from true porcelain. The Egyptians as early as the time of Thothmes III. of the Eighteenth Dynasty, about 1600 B.C., occasionally made small objects of pure glaze or enamel without any core. To distinguish such pieces from true porcelain, is a mere exercise of nomenclature. Like the Chinese and Japanese, the Egyptians were very fond of blue, and the allied colours, peacock green and purple, but they also used browns, yellows, and especially a delicate creamy white. Specimens of these colours and others are common in all the museums; but Mr. Janvier does not give any analysis of the chemical means used to obtain them. His analytical tables are otherwise extremely full. It is curious that the Greeks confined themselves to the more sober hues. Brown and black, with occasionally white and red sparingly applied, were their most usual colours. "Apparently

they did not choose to do more, for it seems incredible that, with their intercourse with the Egyptians and Persians, they should not have known about their various coloured glazes."

The rarity of pottery all over Europe after the fall of the Western Empire is a curious fact, for which it would be difficult to find a satisfactory explanation. The practice of making encaustic tiles, which became one of the most beautiful of mediæval arts, betrays a revival; but vessels of similar material and decoration seldom occur. It was probably, as Mr. Janvier remarks, through Spain, in the time of the Moorish occupation, that the revived art of the potter spread throughout Europe. By the beginning of the eighth century the Moorish wares of Spain had become famous. It is from an offshoot of the Moorish manufactures in the Balearic Islands that Majolica, or Majorca ware, gave its name to all kinds of glazed pottery. German stoneware, much of it very beautiful, reached perfection towards the end of the sixteenth century; but simultaneously the delicate Oiron pottery, or Henri II. ware, "was created by a woman's taste." Of this manufacture, which was begun by Hésène de Hangeat, a widow of noble family, in her castle of Oiron, only about sixty-seven specimens remain; but it has been deceptively imitated of late years. In England, before the last century, pottery was rarely used, and our ancestors ate from wooden trenchers, and drank from horn cups, to a very late period.

If we turn to Messrs. Audsley and Bowes for information on the Japanese origin of pottery, we find that nothing is definitely known regarding the date of its introduction, and that it is probably, as in Egypt, of primeval antiquity. The potter's wheel is said to have been first used by a priest named Giyogi, a native of Idzumi, in 724 of our era; and it is stated that the art of making pure porcelain was introduced into Japan about 1513. If we may trust the Chinese historians, porcelain was known in China some two thousand years before, and was made in Europe even earlier than in Japan. Mr. Janvier asserts that "the very first porcelain made in Europe was in Venice, there being in the archives a letter, dated 1470, from Uielmo da Bologna, that seems conclusively to prove this fact." This art was, however, lost, to be revived again in France about 1695. The porcelain was what is known as "soft"—that is, the materials from which the paste, or body, was mixed were not thoroughly fused together. In 1709, Böttcher, a German, after repeated failures, succeeded in producing true "hard paste," at Meissen, near Dresden. It was not for nearly a century that hard paste penetrated to England, but in 1800 Josiah Spode "crented, or rather perfected, what was practically a new ware, the bone phosphate porcelain, the only kind now made in England."

The new edition of the *Keramic Art of Japan* will be within reach of many who could only hope to consult the original edition in public libraries. The letterpress appears to be mainly the same, and many of the more beautiful illustrations are reproduced. Of their beauty we have more than once expressed our admiration. The publication of such a work as this marks an epoch in the history rather of English than of Japanese ceramics, introducing us as it does to triumphs of art which must form objects of emulation. It is impossible for the intelligent potter to see such pictures as these without experiencing an improvement in his taste and an enlargement of his range of knowledge. Emulation need not mean mere imitation, though much good work done now is little else. In an age like our own, when everything good made at any other period of the world's history, and much that is bad, are being imitated, it would be hard to name any kind of pottery and porcelain which has not its modern representative. In this activity England unquestionably takes the lead. The beauty of English pottery has been greatly increased of late years, and artists who would be great in almost any line are busy moulding and decorating vessels for all kinds of uses, to be sold at all varieties of rates. The English porcelain is of a soft creamy colour, very agreeable to the eye and very suitable for decoration. Nearly all the ordinary "kiln colours" can be used on it, and beautiful wares of all kinds are made. Mr. Janvier praises "the most celebrated English firms" for employing foreign as well as native artists, but observes that even their work is especially English in style. This is very true, and it is also true that the most glaring offences against good taste in china-painting are thus produced. Soon, it may be hoped, a native school, second to no other, will have sprung up; and we shall have no more cause to complain of conventionality run wild, stiffness in drawing, or crudeness in colouring. We have touched chiefly on the historical side of Mr. Janvier's work, but he gives full technical directions for moulding and painting, and most useful chronological and chemical lists. Mr. Janvier's book, like that of Messrs. Audsley and Bowes, concludes with an excellent index.

SACKCLOTH AND BROADCLOTH.*

MISS MIDDLEMASS is not content with writing silly stories; she must, moreover, set up as a lady of learning. Her printers have had to get out their Greek type—a little of it, at all events—in order to do full justice to her classical knowledge. The result is not so satisfactory as the attempt was praiseworthy, for *κῦδος* we find given as *redos*. It

is on page 40 of volume ii. that this reading is to be found. We are the more particular in mentioning this as in another part of the book the same attempt is made, and with greater success. One of the chief of her characters—her hero, for all we know, for he marries the only daughter of an earl—is the Rev. Mr. Sivewright, a clergyman of “classical proclivities” and of “elegant scholarship.” His scholarship would seem to have grown a little rusty since his Oxford days. He opens the story by quoting in “his clear, well-educated voice” Horace, or what he, or Miss Middlemass, assumes to be Horace, “Quid brevi fortis jaculamur (sic) ævo Multa.” It is scarcely likely that to him a deponent verb was a source of insuperable difficulty. We can easily believe, however, that our author may have got just far enough in her regular verbs to feel sure that Horace did not write “jaculamur,” but “jaculamus.” Without any hesitation, therefore, she corrected the quotation, which, it is likely enough, had been supplied to her by some more advanced student. At least twice more she tries to quote the same poet, and with even worse results. We read, “requit (sic) consistere rectum,” and “nos in æternum (sic) exilium impositura cymbra” (sic). The scraps of French scattered through the book are not much better. As regards accents, the author does best when she passes them over altogether; for, when she remembers to introduce them, it is much more than an even chance that she makes a blunder. Her errors are not, unfortunately, confined to accents. Thus we find a “catalogue raisonnée.” But here, again, we must guard ourselves against a charge of laying at her door sins of which she is not guilty. It is in the first volume that she makes “catalogue” feminine. In another passage, we believe—but we have mislaid the reference—she agreeably varies the gender. Whether, moreover, at the same time she corrects her spelling and writes “raisonné” that we forget. Early in the second volume we read that a lady’s dress was *chiffonné*. Sixty pages or so further on we find that another lady looked “a *chiffonné* wreck of pleasure.” Not only does our author here vary the spelling, but also the gender. It is not easy to see, however, why the English word for dress should be masculine and the English word for wreck should be feminine. In the same volume we come across such a gross blunder as “*une petit (sic) suiva*.” Some excuse might perhaps be made for the novelists of the present day when they thus bring in their scraps of foreign languages. It may be, after all, that it is their modesty, and not their conceit, which moves them. They may have discovered for themselves that they most certainly cannot write their mother-tongue, and they may have hoped that their French and their Latin are not quite so bad as their English. We are to some extent willing to accept the excuse. For many a long year have we week after week seen our language most shamefully misused and tortured by the swarms of worthless writers who are always on the buzz; but yet we never grow the least more used to the sight. But when any other language is ill used we can bear it with patience, and can content ourselves with a laugh at the absurd display of pedantic ignorance. We are in this somewhat like the old farmer who, when he was pined with arguments for Free-trade, listened in silence till he was told to remember how much good it would do, not only to Englishmen, but also to foreigners. “There’s a kind of people,” he said, “that I have no manner of feeling with.”

But it is time to pass from our author’s language to her story, though the account that we shall give of this will at once lead us back to her language. For it is impossible to bring before the reader the fine people in whom she delights unless we use her own words to describe them. For instance, the Vicar makes his introductory quotation from Horace to the wife of a squire. Now there are squires and squires, and Mr. Desborough and his wife were at the very top of the class. This is at once understood when Mrs. Desborough is introduced to us sitting gracefully at home on a satin sofa in one of the rooms of an old pile that stood in a grand old seignorial estate, with her matronly figure undulating with creamy lace, and her genial smile. Moreover, she is hand in glove with a duchess. By the way, are not our novelists becoming a little rash in their extravagant use of dukes and duchesses? Few stories are now thought complete without one; and yet, when we have once grown used to ducal rank—and we are growing used to it very fast—on what can our writers rely to excite our feelings, not only of admiration, but even of awe? It was but the other day that at a country railway-station a gentleman was heard to exclaim, in reply to some interesting anecdotes about one of these great men who lived in an adjoining county, “Damn the Duke, sir. Let us talk of something else.” The fault really rests with our novelists. We warn them that, if they do not remain contented, for a time at least, with a marquess, damning dukes may become lamentably common. Be that as it may, it is a Duchess that we have on our hands at present, and she is protected by her sex from every profane utterance. She was not of noble origin, but was merely the daughter of a rich commoner. “Yet she was well qualified in every respect to fill a duchess’s place, wearing his [the Duke’s] honours with little sovereign airs, and dispensing her hospitalities with a knowledge of amalgamation and combination of which the Duke was totally ignorant.” She was also “queen-like, swan-like, undulating”—at least, so she was described by the Vicar, whose scholarship was elegant. She was a fair châtelaine, a graceful stately Duchess. When she drove out she drove in a ducal carriage, and, what was no less surprising, her servants also were ducal. Letters that were taken either to her or to her husband were given into ducal hands. The very stables were ducal, yet so great was the ducal condescension that they opened on one occasion to receive a

country parson’s equine companion—in plain English, his cob. It is pleasant to know, where all was so very grand and ducal, that the Duchess was not above “sipping the gossip-flavoured beverage, alike welcome in the castle and the cabin”—in other words, she drank tea. Great though she was, she was surpassed by the only child of an earl. But it is vain to attempt to paraphrase our author’s language, and we shall therefore let her, in her own words, describe this young lady, this “scion of nobility” we mean. Lady Valentina was, then, the only daughter of the fourteenth Earl of Beaurepaire. “Her associates were all of what is vulgarly called ‘the first cream.’ All had much the same training, blood, and opportunities as herself.” She was, we are told, a class-type. Hauteur was stamped upon her nature, and her beauty was royal. Her father’s house in Belgrave Square had a super-portal gardenette, and in it she enunciates an interesting physical fact, and gets introduced to the reader. She looked very regal as she sat in a tight-fitting black velvet dress, with a large ruffle of creamy lace about her neck. How she would have looked had the dress been loose-fitting or yellow, and had the lace of the ruffle been buttery instead of creamy, that we are nowhere told. In a white satin dress, however, she looked superbly regal; and in buttery lace, for all we know, she might have looked regally superb. It is scarcely surprising, considering her long descent, that she surpassed even a ducal wife—a duchess, we mean. “The Duchess,” our author tells us, “was *grande dame* to a degree that crushed the uninitiated; but all the lustre of her queenliness paled before the more effortless unaimed at tranquillity of the imperial Valentina.” The following specimen of the conversation of these two ladies of rank cannot but be interesting to the reader:—

“You, duchess; oh, yes, of course you are privileged to speak as you please, still I disagree with you. Nothing, according to my opinion, is so detestable as strongly-marked individual qualities. Did I unfortunately possess them, I would devote my life to uprooting them as though they were upas trees.”

“Yet rapidity is surely a worse poi-on than originality,” persisted the duchess. “For my part, I would rather be called clever than *bon ton*; but not being clever, I try to *faire valoir* my position. I am sure that the world would be very stupid if everybody was —of us.”

“Oh, duchess! how can you hold such heretical opinions. I once heard one of papa’s political friends say that refinement is death to originality, and I instantly voted him a boor, and took no further trouble to talk to him, though I was told he was amiable and a *parti*.”

“Lord Beaurepaire is very anxious you should marry,” said the duchess; “he was talking to me about it only a day or two ago.”

As a balance to these very grand people, we have “a master-work of diaphanous pink,” who is little better than a very dull copy of Becky Sharp, and who makes “vain efforts to vie with ducal riches.” Yet at first she seems to be on the most friendly terms with the Duchess. The reader soon learns that she knows some ducal secret, the disclosure of which might greatly disturb the ducal peace of mind. In the end she is bribed not to reveal it. She and the Duchess part for ever, and the Vicar smiles as he thinks “of the fibril texture of that diaphanous fabric called ‘female friendship.’”

In this secret and in its disclosure is to be found, we suppose, something of what is meant by a plot. But the grand people get in the way so very much, and so very often block up all progress, that the plot is very apt to be forgotten. There is, of course, some love-making. The Squire’s elder son makes love till he gets killed in a railway accident, and then his younger son makes love to two ladies at the same time. The Vicar, who deserves censure for his misquotations, makes love, though he is a man of fifty. The Earl, who is a widower, and a good deal more than fifty, makes love, and a Cheap Jack also makes love. No ladies, however, get married but Lady Valentina, and a girl whom we have quite forgotten to mention, though probably enough she is meant for the heroine—“the pink, and white, and flaxen sweet-faced Claire Bailey,” the daughter of Lady Laura Bailey. Something must be left to stimulate the reader’s curiosity, and we will not, therefore, let out who are the happy men who win the hands of these two ladies. We have stolen the plums of the book in quoting the passages that describe the Duchess and the only daughter of the Earl. We will maintain some show of moderation, and will leave the conclusion for the author to tell in her own words.

FRENCH LITERATURE.

THE Abbé Galiani was one of the most amusing members of the “philosophic” circle in the eighteenth century; but his literary fame has not hitherto fared very well at the hands of publishers and editors in what was almost his adopted country. Hitherto he has been chiefly known by references to him in Diderot’s correspondence, which are, for the most part, piquant enough. About six years ago his own letters received a double editing, which was rather worse than none at all. Barbier, the authorized editor, omitted many passages from a feeling of prudery; while a well-known pirate of the day, Antoine Serisy, who contrived to foist another edition on the market before Barbier’s, actually forged several pieces to give his version originality. The edition, therefore, which MM. Perey and Maugras have undertaken, of which the first volume (1) has appeared, cannot be said to be superfluous. It opens with a good essay on the author, which will

(1) *L’abbé F. Galiani; Correspondance*, &c. Par L. Perey et G. Maugras. Paris: Ch. Lann-Léry.

serve to freshen the memories of a few readers, and inform those of most, as to the once famous *Dialogues sur les blets* and their writer. The letters themselves are characteristic enough of the Grandval *cinacle*—good-humoured, witty, exceedingly free-spoken, but showing a kindly and intelligent nature. On religious and philosophical subjects they are perhaps rather Voltairian than Holbachian. The Abbé was a great archaeologist, and especially an authority on coins and medals. His letters contain not a few anecdotes which go to show that the common notion that numismatists are even more lax in their ideas of property than bibliomaniacs is by no means ill founded.

M. Wallon makes rapid way with the instructive but lugubrious and rather monotonous task which he has imposed on himself. His fourth volume (2) opens with the preliminary examination of Océile Renault for attempting the life of Robespierre (Prairial an II.), and extends to Messidor of the same year, ending with the huge *fournées* of victims (sixty on the 19th, fifty on the 21st, forty-six on the 22nd) sacrificed in consequence of the pretended conspiracy of the prisons. No individual victim of great note emerges from the crowd of murdered men and women during these months, unless it be the infamous Jourdan Coupe-tête, in whose case the Saturn-like propensities of the Republic are certainly not to be regretted. But every page is a fresh and conclusive indictment against the Revolution. The blood which flowed in most of these cases was perfectly pure, at least in so far as the immediate cause of death went. *Tropus incitigurs* is, perhaps, the commonest charge. One person is accused, because by exhibiting himself minus a leg, he has deterred recruits from enlisting; another, for selling images of saints; others for opposing the destruction of a statue of Stanislaus Leczynski; others for refusing to take assignats at par. And thus Fouquier Tinville and his accomplices are kept well up to their work.

That it cannot have been altogether desirable to be Mme. de Staël's husband is a proposition not likely to be disputed by anybody acquainted with Mme. de Staël's works. M. Léonzon le Duc's volume (3) now does something more for M. de Staël than this. The object of the author is, indeed, rather historical than biographical, and he adds to the correspondence of the Ambassador that of his successor, Baron Brinkman. Incidentally, however, he succeeds in showing that M. de Staël was a person of no inconsiderable talent and of an upright and steadfast character. The notorious sympathy of the Swedish Ambassador for the revolutionary party, a sympathy which does not seem to have been by any means merely the result of the inspiration of his wife, and which was strong enough to oppose directly the projects of his master, Gustavus III., has, it would appear, somewhat biased his biographer. But M. Léonzon le Duc, if not absolutely unbiased, is a very fair writer, and he makes out a grave case against Gustavus as being by no means a disinterested champion of royalty for royalty's sake. The correspondence of Brinkman dates later—in fact, on the eve of Napoleon's *coup d'état* of Brumaire, and is a contribution far from valueless to the history of that important crisis.

The second volume of M. Lenormant's *La grande Grèce* (4) is occupied for nearly half of its space with the great and interesting city of Croton, a subject which lends itself particularly well to the author's system of mingled historical and topographical treatment. The two hundred pages which Croton occupies are followed by a short, but very attractive, chapter on the famous temple of Juno-Lacinia (it seems to us, on literary and not pedantic principles, right to use the Roman form in reference to a place whose main interest concerns Roman times, though M. Lenormant, with the fear of modern sciolism before his eyes, uses Hera). This, almost the sole surviving edifice which has direct connexion with the great Carthaginian chief, survived intact, or nearly so, till the sixteenth century, when a friend of a bishop—most happily named Antonio Lucifero—pulled most of it down to build his palace at Croton. Catanzaro and Squillace, rich in mediæval memories, complete the list of the subjects of the volume.

Venetian ambassadors and ambassadors to Venice have contributed notably to the library of diplomatic literature. M. Zeller's rather ambitiously titled book (5) concerns itself with the embassy of a certain Guillaume Pellicier, Bishop of Montpellier, to the Seignory during the years 1539–1542. The materials are very well worked up, so much so that the book really answers to its title, inasmuch as it shows the multifarious duties, now divided, as far as they are recognized at all, between ambassadors and consuls, which a plenipotentiary of the sixteenth century had to fulfil in reference to art and literature and commerce as well as to politics.

The tenth and eleventh volume of M. Thiers's speeches (6) cover the years 1865–1868. Among the speeches here collected are, it is hardly necessary to say, many in reference to German policy in the year 1866. It is also hardly necessary to say to students of political history that these speeches display in many parts a

remarkable political prescience, joined to a certain incapacity to comprehend the actual state of France and of French power. Still more exciting at the time, though they are less interesting now, were the discourses on the Mexican expedition and on the liberty of the press (Feb. 1868).

It is not very easy to decide whether a sign of the times is or is not to be discovered in the multitude of semi-philosophical, semi-political essays of an eighteenth-century character which now issue from the French press. We have before us several such at the present moment, and we cannot say that their literary or philosophical ability by any means equals the zeal with which the authors have attacked large subjects easy to talk about with a very little knowledge, but not easy to discuss with any chance of profit to the reader, unless the essayist is a rather exceptional person. M. Ferraz (7), who seems to be a veteran schoolmaster of considerable official distinction, discusses the rights and duties of man, in a manner which does not strike us as original or exhaustive. *Occultate your minds, keep your tempers, do not commit suicide, respect other people's rights*, says M. Ferraz—maxims excellent, but a little trite. M. Deschanel (8), who has, if we mistake not, been honoured by the Republican party since the appearance of this book with M. Littré's seat in the Senate, has produced another book which is in part of the same hollow kind, abounding with the specious generalities (*Le travail est le père du droit, &c.*) which have always been the curse of French politics. M. Deschanel, however, writes at any rate with knowledge, if with a certain *parti pris*; his book is abundantly supplied with facts, and his historical and literary equipment gives him some texts (notably the *Satyre ménippée*) on which it is difficult to be dull.

L'être social (9) is yet another of the little books on great subjects which are so easy to write and so difficult to write well. M. Hayem shuffles his platitudinous counters with a great deal of gravity, and that is the most we can say for him. M. Gilliot (10), on the other hand, has attempted not so much the difficult as the impossible, that is to say, to give the origins of religious and social institutions in two hundred pages. He is careful, if not always accurate; quotes a good deal, and not always without advantage to the reader; but it is not easy to believe that his book can be of much service to any real student. All these books are respectable enough in intention. M. Desmazo has only to thank his sensational title (11) if a suspicion is aroused by it of an unworthy purpose. There is, however, little that is really objectionable in the book, which is a bald and very incomplete summary of some of the facts of its unsavoury subjects.

M. A. Brachet (12) laboriously exculpates himself in his preface from the charge of having composed his book *à propos* of the Tunisian expedition. The exculpation seems sufficient, but leaves a considerable feeling of surprise in the reader. For the only apparent motive which M. Brachet could have had for blackening the Italian character and stirring up French bile against Italy vanishes.

Three small pamphlets deserve notice—a short but clear essay (13) on Jewish history, by M. Darmesteter; an energetic protest (14), by a writer who does not give his name, against the Tunisian expedition; and a very good reprinted tractate (15) on French pronunciation.

In *Russes et Allemands* (16) M. Victor Tissot has collected divers articles which have proceeded from his lively and industrious pen on the two subjects of his title. M. Tissot, who is nothing if not picturesque, does not fail to avail himself of the opportunities given by Nihilism, bureaucratic corruption, &c. But it is hardly necessary to say that the most vigorous strokes of the tar-brush are given, not to St. Petersburg, but to Berlin. M. Tissot's opinions on the moral shortcomings of the *pays des milliards* are sufficiently well known.

It is becoming a regular custom for the contributors of French journals to reprint their lighter articles under some eccentric (catchpenny, the unkind it call) title. *Gare les jambes!* (17) is simply a collection of rather personal papers on various subjects. We cannot honestly say that they were particularly worth reprinting.

The novel results of the new system of universal military service in France have naturally suggested themselves as a promising subject to many ingenious writers. M. Henri Amic's (18) "Month with the Reserve," which M. Bastien Lepage has decorated on the cover with a presentment of an exceedingly smart recruit, is a well-written little book, without bumpiousness or straining at jocular effect. It gives an apparently faithful and not uninterest-

ing picture of the mild hardships and placid excitements of a month's soldiering.

No one who speaks with knowledge, whatever his dislike to the principles, the conduct, or the results of the French Revolution, can honestly deny that a good deal of construction as well as an immense amount of destruction was accomplished under it. Perhaps not the least of its less obnoxious feats was the relieving of France from its old reproach of being the worst educated of the fully civilized countries of Western Europe. M. Hippéau (19) has added to his already very considerable work in the departments of *belles-lettres* and of educational science an interesting reprint of speeches and reports on the subject of education during the Revolutionary period. The value of the collection may be roughly indicated by mentioning that Mirabeau, Talleyrand, and Condorcet are among the authors, as well as the inferior, but still important, names of Romme, Daunou, and Fourcroy. Two of the excellent year-books with which France is perhaps even better provided than England present themselves rather late, but in all probability as early as possible. The range of *L'année artistique* (20) is very wide, embracing not merely Europe, but the United States, and aiming at the supply of information not merely as to exhibitions, sales, &c., but as to the art administration of the different countries. The execution seems fairly satisfactory, considering the vastness of the plan. The theatrical and musical Annual of MM. Noël and Stoullig (21), on the other hand, practically confines itself to the Paris stage, and a stout volume of nearly eight hundred pages gives room enough for treatment. The editors have even reprinted the proceedings in the suit of the Français against Mlle. Sarah Bernhardt, during which that lady's advocate discovered the famous resemblance between Mlle. Bernhardt and Titania.

We may notice in the *Revue des arts décoratifs* (22) a plate representing a very remarkable piece of chasing in iron by M. Émile Vernier.

Some poetical and dramatic work, new or reprinted, of interest comes before us this month. M. F. Coppée's *Contes en vers et poésies diverses* (23) has reached in its third edition, an honour not common to French poets nowadays. It contains some fair examples of the rather facile pathos which has made M. Coppée popular. There is a good legend for M. Bonnat's well-known and admirable portrait of M. Victor Hugo. But we must own that the piece we like best in the book is a ballade of M. Théodore de Banville's in reply to M. Coppée.

The late M. Paul Albert was a *professeur* of talent, who died just after his election to a chair at the Collège de France, the great ambition of schoolmasters in that country. His son now edits some remains (24) in prose and verse. The prose consists of critical essays on literary subjects. They are well written, full of sensible and just reflections, and hold the balance between classics and romantics with an even hand. A certain timidity almost approaching to frigidity of expression, and an absence of grasp and freshness of view, are their chief drawbacks. It is not clear whether these arise from personal modesty, which seems to have been a characteristic of the author's, or from an exaggeration of the academic habit of avoiding anything startling or eccentric. The verse is often pleasing, but rarely vigorous, though there are some fair philosophical sonnets. One poem has, we confess, puzzled us. M. Albert has an indignant sonnet, dated 1871, recapitulating the woes of France, emphasizing its desire for vengeance, &c., and ending

Le deuil est sur la France ! Et c'est dans ce moment
Que Vendôme à Ronsard élève une statue.

We should like to ask, Why not ? How is the commemoration of the great Frenchmen of the past unpatriotic or undutiful to the France of the present and the future ?

Under the title of *Paravents et tréteaux* (25) M. Jacques Normand has published a pleasant volume of dramatic trifles—monologues, prologues, epilogues, et omne quod exiit in loquac. These things are popular in France just now, thanks to the talent of M. Coquelin and others of their interpreters, and M. Normand fashions them with considerable skill.

The useful *Théâtre de campagne*, a treasure for persons addicted to amateur theatricals, has reached its seventh volume (26). The contents range from comedies to monologues, and among the authors are MM. Legouvé, Cros, E. d'Hervilly, G. de Latorière, Guilleminot, Normand, &c.

M. Raynard's careful, if not very spirited, prose translation (27) of the *Orlando Furioso* has reached its fourth and last volume in M. Lemerre's pretty *Petite Bibliothèque Littéraire*.

M. Paul Sébillot's Breton tales (28) have all the appearance of

being the genuine collections of a trustworthy "folk-lorist." This appearance is not injured by the fact that they are for the most part rather prosaic in form (though not in substance), inasmuch as no suspicion of working up is possible. Many of them belong to a special and interesting class, the legends of the "houles" or sea-washed caves of the Côtes-du-Nord. The others include, of course, variations of universally prevalent stories. Among the less common of these may be noticed two or three versions of the incident which forms the basis of "Wandering Willie's Tale" in *Redgauntlet*.

Among novels the first place must be given to *Le bachelier* (29), the second part of *Jacques Vingtras*. Politically speaking, we can pretend to no great esteem or sympathy for M. Vallès. But he is perhaps, out of Russia and Germany, the most typical representative of the genuine Irreconcilable who has sworn war to the knife against social arrangements merely because they are social arrangements—the *réfractaire*, as he would himself call the animal; and he is certainly one of the most accomplished in a literary point of view. His perverse bitterness, further embittered, rather than sweetened, now and then by a kind of acrid good sense, finds a literary expression, which is not at all to be despised, in *Jacques Vingtras*. The follies of the younger Republicans in 1848-1851 are depicted here with a really admirable mixture of satire and regret; and the desperate hatred of the *Coup d'état* which all France now pretends to feel, but which at the time was limited to a very small fraction of the people, has never been better expressed, nor its reason—the impotence and cowardice of the anti-Imperialists themselves—more clearly indicated. The book also contains curious and apparently autobiographical struggles of a young man who has education and nothing else. This giving of education and nothing else is, it should be said, a main ground of M. Vallès's quarrel with society; and here he is perhaps worth the attention of educational reformers. M. Fortuné du Boisgobey, in *Le pavé de Paris* (30), well sustains his reputation as a purveyor of sensations. A great deal of gambling, a murder, a duel where one combatant is spitted like a lark and the other has his head simultaneously split like a coconut, await the eager amateur. Of its kind the book is not a bad one, though it introduces the reader to some very bad company. M. Hector Malot (31), in a fairly interesting book, has been bold enough to make his heroine black—actually black—and of the "nigger" type. M. Garennes (32) or his publishers have thought, it seems, that the glorious successes over the Kroumirs demand the re-impression of a Chauvinist novel of the Empire. The difference of tone strikes the ear oddly, but who shall say which is the more false—the cant of twenty years ago, or the cant of to-day ? *Pascaline* (33) is a rather uninteresting crime-and-spiritualism novel, written in the awkward and now hackneyed form of a judicial dossier, composed of narratives and depositions of different persons.

(29) *Le bachelier*. Par Jules Vallès. Paris : Charpentier.

THE VICTORIA UNIVERSITY, MANCHESTER.—The STATUTES and REGULATIONS regarding DEGREES, EXAMINATIONS, and COURSES of STUDY are now published. Students, and others desirous of information, may obtain copies, on application to the Registrar.

R. ADAMSON, Registrar.

SOMERSETSHIRE COLLEGE, BATH.—An EXAMINATION will be held on July 13 and 14, to elect SEVEN ENTRANCE SCHOLARSHIPS.—Particulars may be obtained from the HEAD-MASTER.

PREPARATORY EDUCATION.—TWO SCHOLARSHIPS of 30 Guineas per annum, in a First-class SCHOOL on the South Coast, will be given in July to BOYS under Eleven, who are intended for one of the Public Schools. Preference will be given to the Sons of Clergymen, and easy Examination Papers will be sent to the homes of applicants.—Address, CLAUDE, care of Messrs. Atkin, Gabbins, and Kilik, 24 Sackville Street, London, W.

MALVERN COLLEGE.—The NEXT TERM commences Tuesday, September 27. For particulars, apply to HENRY ALDRICH, Esq., Secretary.

TRINITY COLLEGE SCHOOL, STRATFORD-ON-AVON.—The Warden, RICHARD CURRY, M.A., is assisted by Seven Resident Graduate Masters, two being specially for Modern Languages. Special preparation for the Universities, Army, and all competitive Examinations. Exhibition to the Universities of £20 per annum; Junior Department for Young Boys. Large Playing Fields, Gymnasium, &c. &c. Terms 50 and 40 Guineas.—Apply to the WARDEN.

ST. EDMUND'S COLLEGE, SALISBURY.—A HIGH-CLASS SCHOOL for BOYS of GENTLEMEN. The religious training is upon definite Church principles. Boys are Educated with much care and thoroughness. They receive individual teaching and help wherever needed. Candidates for Matriculation at the Universities are specially prepared. Terms, £75 a year.—For references, prospectus, or any further particulars, apply to the Warden, Rev. G. H. BOURNE, D.C.L.

DAVOS.—Mr. J. W. LORD, M.A., Fellow of Trinity College, Cambridge, is desirous of taking a limited number of PUPILS to prepare for entrance at the Universities. Entrance Mathematical Scholarships, or other Examinations. The climate of Davos is particularly beneficial in cases where tracing and strengthening are needed before entering on harder work. Terms £100.—For further particulars, address Wadgate House, Walton, near Ipswich.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon., assisted by a Cambridge M.A. and competent Teachers, prepares PUPILS for the Universities, Woolwich, Sandhurst, and all Competitive Examinations. A few Vacancies.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

PREPARATORY SCHOOL, AMESBURY HOUSE, Penge Heath, DICKLEY, Kent.—Rev. EDMUND FOWLE receives THIRTY-THREE BOYS under the age of fifteen, to prepare for the Public Schools.

The house, surrounded by six acres of land, is situated in a charming locality, thirteen miles from London.

There is every requirement for a high-class Private School, a cricket and football ground, large iron playground, forming gymnasium, &c., two Eton five-courts, workshop, dry playground, and a run of a third of a mile on a dry gravel path.

The soil is gravel, and all the Sanitary arrangements in and out of the house have been under the special supervision of Dr. ALFRED CARPENTER, of Croydon.

Every Educational advantage given and many comforts offered, the greatest care being taken of little boys on their first leaving home.

Great success has been met with, several open Scholarships gained, and in no single case has a boy failed to take his proper place at a public school.

Rev. EDMUND FOWLE is well known by his very successful series of Latin and School Books, and for his Eton Greek Readers, written by special request for that School, and now in use at Eton, Harrow, Merchant Taylors', &c. Terms, from 80 to 120 guineas.

A DERBYSHIRE CLERGYMAN (M.A. Oxon), for several years a successul "Pass Coach" in Oxford, receives SIX PUPILS preparing for Oxford or Cambridge. References to Parents and former Pupils.—Address (until August 1), the ENGLISH CHATELAIN, Hotel Belle Vue, Andermatt, Switzerland.

EDUCATION.—GERMANY, BONN—on-the-Rhine, 37 Baum-schuler Allee. The Fräulein KUNDE receives a limited number of YOUNG LADIES. House comfortable, best master, unexceptionable references.—For particulars apply to the above.

HOLIDAY TOUR in AUGUST (or partly in September).—Redded HEAD-MASTER wishes to take a few quiet BOYS abroad. No objection to moderate knapsack work. Terms reasonable. References.—Address, VICAR, Emeraldale Cambridgeshire.

DOVER COLLEGE.—An ASSISTANT-MASTER is required in DOVER COLLEGE for Next Term. The Salary is £150 a year, with an excellent Boarding-house for Forty-three Boys, free of rent and rates.—Apply, stating degree and experience, to the HEAD-MASTER, Dover College.

SECRETARYSHIP, or other Employment, REQUIRED by a GRADUATE of CAMBRIDGE and BARRISTER-AT-LAW. Would not object to travel.—Address, A. Z., 18 Portland Road, Notting Hill, London, W.

TO BE LET, the MANSION known as "The Grove," Burton Joyce, containing Three large Reception Rooms and Eight Bedrooms, with large Picnque Grounds, Lawn-house and Stables, and 20 acres of Land. There is a large Billiard Room, and also Conservatory and Fernery. The House stands on an eminence and commands extensive and picturesque views. It is within half-a-mile of Burton Joyce Station, and within five miles of Nottingham, and is in the midst of a hunting and sporting country.—For further particulars, apply to Mr. LEONARD MILLS, "The Grove, Burton Joyce, Notts.

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel. BENJN. BULL, Manager.

ILFRACOMBE HOTEL.—On the verge of the Atlantic, in its own Grounds of Five Acres, with Tennis Lawn. Contains 250 Rooms, and is "a model of sanitary excellence." One of the largest and best in England; also Private Sea-water Baths.—Every information of MANAGER.

PRESIDENT GARFIELD.

THE attempted murder of the President of the UNITED STATES is a crime as strange as it is shocking. It was not known that Mr. GARFIELD had an enemy, though he had lately come into collision with an inveterate political opponent. There is little perceptible difference in opinion between the party which elected him and the Democrats, who only maintain their separate organization for the purpose of obtaining office in their turn. The feud between the PRESIDENT and Mr. CONKLING was perhaps somewhat more bitter, because it involved a merely personal issue; but a squabble about the appointment of a revenue collector could scarcely arouse the violent passions which are the most usual cause of political assassination. It seems probable that in this instance the murderer was irritated by disappointment in his hope of official employment. A somewhat similar provocation led to the murder of Mr. PERCEVAL and to attempts which were made on the lives of Sir R. PEEL and Lord PALMERSTON. It is not improbable that the notorious frequency of similar crimes in Europe may have suggested to a weak and vicious mind the possibility of revenge. European or exiled assassins have impaired a main security for human life by making the thought of murder familiar. A principal sanction of the morality code is furnished by unquestioning belief in the universal acceptance of its precepts. Even the miserable excuses which have been made for similar crimes are not urged by any sympathetic apologist in the case of Mr. GARFIELD. The assassination of Mr. LINCOLN sixteen years ago was less surprising, though it excited unanimous feelings of reprobation and horror. The passions which had been aroused by the civil war had not begun to subside, and a few defeated combatants may have regarded the President as the representative of their victorious oppressors. It afterwards appeared that the crime was an isolated act, unconnected with any organized conspiracy; but at first it was naturally supposed to be a result of political motives. Except by the tenure of high office, Mr. GARFIELD has been little known to his countrymen; and down to the date of his nomination his name had not been heard in England or the Continent. The Union enjoys profound peace and unexampled prosperity, and the principal drawback to its felicity has been the absence of any political issue which would form the subject of an interesting controversy. Where Mr. GARFIELD is known he is personally liked, and he belongs to the most popular class in the United States, inasmuch as he practised manual labour before he became a lawyer, a politician, and a President.

According to some accounts, the assassin has endeavoured to give a political colour to his crime by asserting that he was a "stalwart" and a supporter of ARTHUR. The phrase belongs to the latest jargon of New York politics; and it apparently describes adherence to the faction of which Mr. CONKLING is the leader. It is utterly incredible that any section of American politicians should design or approve the atrocity which has been committed; but election managers are capable of founding a charge against their opponents on the desperate attempt of a criminal to propitiate possible allies. The nomination of Mr. ARTHUR as Vice-President was a concession to the section of Republicans which had under the guidance of Mr. CONKLING endeavoured to nominate General GRANT. In the recent dispute on patronage Mr. ARTHUR took the side of Mr.

CONKLING against his own colleague and chief. It was remarked as an anomaly that the possible successor of Mr. GARFIELD should support the claim of the leaders of the Senate to control the patronage of the President. Probably Mr. ARTHUR felt himself bound in gratitude to assist the patron to whom his own promotion was due. American parties have shown habitual indifference to the qualities of a Vice-President, although in three instances he has succeeded to the Presidency. The notorious unfitness of Mr. ANDREW JOHNSON for the office which he held after the death of Mr. LINCOLN would have deterred his party from giving him a nomination as President; but he was considered to be entitled to a reward for his desertion of the Democratic party, and for other services which he had during the war rendered to the cause of the North. The title which was conferred as a compliment involved the right of succession to the highest post; and the carelessness of the Republican managers was rewarded by four years of incessant struggle and by an abortive impeachment. There would be no reason to fear the recurrence of similar complications in consequence of the possible succession of Mr. ARTHUR, who is an adroit politician of the customary type; but he might probably disappoint some ambitions which were encouraged and gratified by Mr. GARFIELD. The new President would have had the right to form a Cabinet of his own; and he might not improbably have taken the opportunity of relieving Mr. CONKLING from the consequences of his ill-judged resignation. It seems that Mr. CONKLING has no chance of re-election as Senator; and his colleague and humble follower, Mr. PLATT, has been forced to withdraw in consequence of opportune discoveries made by his adversaries of certain defects in his moral character. A new President might, if he could obtain the confirmation of his appointments by the Senate, substitute Mr. CONKLING for Mr. BLAINE as Secretary of State. The Republican leaders would not regret the closing of the schism which divides their party in New York, if not also in other States. Mr. CONKLING, who would have been Secretary of State if General GRANT had been elected, would have welcomed the opportunity of supplanting his rival.

It is possible that the attempt to assassinate a Republican chief magistrate may modify the ill-concealed toleration with which democratic agitators and factions have regarded the crime of regicide. The numerous political writers who deduced from the murder of the Emperor ALEXANDER the inference that his successor ought to grant a popular Constitution were perhaps scarcely conscious that they were assuming the character of apologists for a brutal crime. The assumption that the fanaticism of the Nihilist conspirators was only an exaggeration of legitimate discontent was calculated to diminish the general indignation and horror. It is not uninteresting to observe the entirely different spirit in which the representatives of extreme English Radicalism discuss the attack on General GARFIELD. Kings and Emperors are supposed to be excluded to some extent from human sympathy; but the freely elected PRESIDENT of the great American Republic ought, in the opinion of extreme democrats, to have been as secure from violence as the humblest member of society. Some Republican enthusiasts will perhaps gradually learn that the security of life largely depends on the sentiment with which murder was formerly contemplated as in all cases the blackest of crimes. The villains of different countries who successively

attempted the lives of the German Emperor, the King of Italy, and the King of Spain may probably have had a share in familiarizing the minds of Russian conspirators with the crime which they afterwards perpetrated. The wretched adventurer who has now tried to revenge himself for petty political disappointments on the President of the United States had probably been demoralized by the example of European cutthroats. Land League orators whose hints find expression in murder and outrage committed by their followers have contributed their share to the latest crime; and Fenians who incite the Irish rabble of the great American cities to subscribe for the destruction of English public buildings, or of English men-of-war with their unoffending crews, have contributed their share to the confusion of the boundaries between right and wrong. The universal feeling of sorrow and sympathy which has been evoked by the danger of the President may, perhaps, produce a wholesome reaction. It is not surprising that some commentators on the transaction have sought to connect Mr. CONKLING's coarse attacks on Mr. GARFIELD with the outrage committed by one of Mr. CONKLING's obscure adherents. There is no country in which violent language is so unexciting or so innocuous as in the United States. Five or six years ago professedly respectable journals of the Republican party repeated day after day charges of vulgar fraud against the Democratic candidate for the Presidency. Those who made the accusation were incapable of believing it, and the readers whom they addressed understood and imitated the insincerity of their instructors, although they hoped to derive political advantage from denunciation of the hostile leader. In accusing President GARFIELD of treachery and corruption, Mr. CONKLING was probably understood only to express his undoubted hostility to a victorious rival. No intelligent American thought the worse of the President, or much the worse of his assailant. It is possible that GUITEAU, who had been a delegate in the interest of General GRANT to the Chicago Convention, may have thought that Mr. ARTHUR, as belonging to the same Republican section, would be more ready than Mr. GARFIELD to consider his claim to an official appointment. It is extremely unlikely that he took any serious interest in the quarrel between the New York Senators and the President. To this extent the political practices which prevail in the United States may perhaps have been among the causes of the crime; but there are defects and anomalies in all political systems, and, when the morality of assassination is once regarded as an open question, there will never be wanting a motive or a pretext for murder.

THE LAND BILL.

THE assault which the Duke of ARGYLL delivered against his late colleagues at the end of last week has been so long hanging over their heads that the delay may have enabled them to bear it with more philosophy than would otherwise be at their disposal. Threatened men acquire in this way a kind of adventitious courage; and those members of the Government who were most deeply concerned were fortunately for themselves not members of the House of Lords. The position of Lord GRANVILLE and Lord CARLINGFORD, however, was sufficiently worthy of pity. For years the Liberal party in the Upper House has been even more inferior to its opponents in ability and oratorical power than in numbers. Lord GRANVILLE's pleasant faculty of poccourante conversation hardly enables him even to enter the lists with the Opposition leaders, and Lord CARLINGFORD is not high even in the second class of debaters. Lord DERBY, an important but dubious recruit, has not yet formally taken the oaths to his new party, and has hitherto made no sign whatever on the Land Bill. In all time of tribulation the Duke of ARGYLL has hitherto been the mainstay of the Liberal Peers. His oratorical and intellectual ability has, perhaps, been a little exaggerated by his own party, but no one denies that it is very considerable. The Duke of ARGYLL, with a very large share of the faults of his countrymen, has a more than proportionate allowance of their representative merits. He is thoroughly well informed, he is industrious in an extraordinary degree, and he treats every subject which he handles without, indeed, much breadth or originality of view, but, within his limits, with great good sense and much weight of downright logic. When there is added

to all this the mechanical advantage of a most carefully acquired style and delivery, which, if it never rises to eloquence, frequently attains a range considerably higher than that of mere ready debating, the total warrants the assigning to the Duke of a position (now that Lord BEACONSFIELD is gone) second only to that of Lord SALISBURY, and perhaps Lord CAIRNS. On Friday week all these gifts were turned against the speaker's own side, and the artless excuses of Lord BESSBOROUGH, the endeavours of Lord CARLINGFORD to divide himself into two gentlemen at once—one a Commissioner and the other a Cabinet Minister—and to defend himself in the one capacity when speaking no word in the other, and the desperate attempts of Lord GRANVILLE to contend for a kind of previous question, only enhanced by contrast the importance of the Duke's speech. That speech has, as was natural, been violently attacked by the extreme partisans of the Government, and by the persons individually damaged by it, while, on the other hand, efforts have been made to represent it as a mere academic exercise of no practical value. Yet it is indubitable that in it the Duke of ARGYLL materially weakened and almost destroyed the value of the BESSBOROUGH Commission, that he completely refuted the favourite Radical doctrine of an ancient and long-observed tenant-right, that he proved to demonstration that his colleagues had no business to bring in a Land Bill at all, and that he proved by implication that their actual Land Bill was faulty and bad. The Government were certainly well advised in refusing to meet the assault directly. But no debate and no division on the Land Bill could be more damaging to them than the Duke of ARGYLL's explanation of his parting company.

A majority of 132 on the amended 7th Clause—that is, virtually on the Bill—may have consoled Mr. GLADSTONE for his late colleague's unkindness. It certainly showed that the quality of fidelity may still be assigned without fear to the Liberal party in the House of Commons. It is a vacillating and uncertain fidelity, requiring much humouring and management to keep it undisturbed, but it still exists. There is probably not one single man in the House of Commons except Mr. GLADSTONE who regards the Land Bill on its merits, and without *arrière-pensée*, with any other feelings than those of distrust, dislike, and doubt. To a few Irish members it may be agreeable, because it is another slice of the cake, because it carries out their private crochets, because it offers chances in abundance for future exploitation of the covetous lawlessness of the Irish people. As an attack on landlords' rights, it is, of course, welcome to the English Radicals. As an attempt to settle a question which (owing to what immediate causes does not much matter) evidently demands settlement, it is tolerated grudgingly and reluctantly by a very large number of members. These various feelings, joined to the simpler and still powerful one of subservience in all things to Mr. GLADSTONE's whims, assure the passage of the Bill in some shape or other through the House of Commons. The division against the amended 7th Clause may perhaps be, formally at least, found fault with as inconsistent with the policy pursued at the time of the second reading. Yet, also on formal grounds, it may seem to have been justified by Sir STAFFORD NORTHCOTE's indication of the objectionable words inserted at Mr. RUSSELL's wish. The sting of the clause was, however, extracted by Mr. GLADSTONE's omission of the obnoxious directions as to the manner of ascertaining tenant-right. Mr. RUSSELL's addition is only open to objection because it implicitly asserts the tenant's interest, and that assertion is the object and cause of existence of the entire Bill and of every clause in it.

The main point of importance in the history of the Bill during the present week is undoubtedly Mr. FORSTER's announcement of the Government proposals as to arrears. These have been anxiously expected, and will, no doubt, lead to a good deal of debate. They bear on their face obvious marks of the desire to disarm opposition which, after a long period of directly opposite conduct, has recently marked the Government course. Like all the rest of the Bill, the new provision is an elaborate departure from the ordinary principles which have long governed legislative interference with matters of business in England. Of arrears previous to 1878 Mr. FORSTER takes no notice whatever, and this silence will probably be construed in very different ways. That there are tenants, and many of them in Ireland, whose indebtedness to their long-suffer-

ing landlords extends much further back is certain. Apparently, however, the proposal is that a tenant who pays fifty per cent. of the rent due on 1878 and 1879, and comes to terms with his landlord as to the rent for 1880, is to be protected from disturbance. The evident assumption that many holders will of their own means satisfy the demands of this provision shows more clearly than anything else how hollow the present agitation is and how unworthy most of the complainants are to be assisted. Those, however, who really need help are to be helped out of the all-sufficing Church Fund, which is to advance the sum required, though, inconsistently enough, the landlord, and not the tenant, is to be responsible for repayment. This is to be got out of the tenant by a yearly increment on the rent of the fifteen years' holding which the Act confers. It is almost impossible to say how the plan will work. That many landlords would be exceedingly glad to compound their claims of arrears for half the amount due on 1878 and 1879, and the whole due last year, is certain. But men in a beggared condition, as many Irish landlords now are through the action of Mr. GLADSTONE'S Government, are not able to choose. Such an appropriation of the Church fund as that proposed has, it is curious enough to remark, been protested against again and again by Radical organs beforehand. The tenant's newly-created interest, not the landlord's property, should clearly be the pledge for repayment. On this matter, however, only the first, not the last, word has been heard. The limitation of the fortunate persons who are to benefit by this dead lift to tenants at less than 30l. a year is sure to excite discontent among Irish members. And the stipulation that the tenant come to terms with his landlord as to the last year's rent will exasperate the Land League more than almost anything else can do. The discussion of the proposed assistance to be given for the purchase of the holding included one remark from an Irish member which is perhaps truer than anything else that has been said. This remark was that Irishmen cared for nothing in the Bill save for this particular opportunity of drawing on the public purse. Meanwhile some utterances of interest in relation to the Irish question have been delivered outside the walls of the Houses of Parliament. The Editor of the *Fortnightly Review* has written in that periodical an article urging conciliation with Ireland, which is even more eloquent and interesting than his usual work, but which more than ever suggests the famous and terrible quotation, "Ach! mein lieber Sulzer, Er kennt nicht diese verdamnte Race." Mr. FAWCETT has proved his good sense, and has perhaps surprised and chagrined some of his own party, by elaborately demonstrating the wisdom and justice of the rejection of the Disturbance Bill last year by the House of Lords. Mr. FORSTER may not be grateful to his colleague for awakening the remembrance of his own ill-considered outbreak by a cool argument, that, in face of a dwindling majority in the House of Commons, the conduct of the House of Lords could not be considered unreasonable. This seems to intimate a sobriety of mind which, it may be hoped, is shared by persons more highly placed in the Government than the POSTMASTER-GENERAL.

THE GREEK QUESTION.

THE short discussion on the Greek question which took place a week ago in the House of Lords summed up in an accurate and intelligible form a transaction which, it may be hoped, is now virtually concluded. There was no serious difference of opinion between Lord GRANVILLE and Lord SALISBURY, though it was consistent with custom that the leader of the Opposition should point out incidental miscarriages which, as he candidly admitted, had not affected the result. The Conference of Berlin was undoubtedly a mistake; and Lord SALISBURY might, if he had thought it worth while, have expiated on the risk and embarrassment which it caused. But for the hasty decision of the Plenipotentiaries, or of the Governments which they represented, the Greeks would probably not have spent large sums on their armaments; nor would they have threatened a dynastic revolution as the alternative of war; but the mischief has gone no further. Lord GRANVILLE may probably have formed a cooler judgment than the newspaper Correspondents who were completely deceived by the noisy enthusiasm of Athens. It was evident that the Greek Ministry would have been

guilty of culpable and disastrous folly if they had ultimately refused to accept the proposals of the Great Powers; but sometimes nations are as foolish as private persons, and the Greeks might at any time have deluded themselves by their own warlike language. Lord SALISBURY with sound judgment abstained from dwelling on the evils which might possibly have occurred. With the settlement which is actually effected he has good reason to be satisfied.

The most plausible apology for the award of the Berlin Conference is that it nearly approximated to the recommendation which had been appended in the form of a protocol to the Treaty. M. WADDINGTON had proposed to the Congress a somewhat larger cession of territory than that which was earnestly recommended to the Conference by M. DE FREYCINET. According to both projects, the whole of Thessaly, and a considerable part of Epirus, was to be ceded to Greece. The French Government has never explained the reasons of the change which soon afterwards affected its policy. Even after the Berlin Conference, M. DE FREYCINET only consented to take part in the naval operation near Dulcigno on the condition that the allied fleets should afterwards be despatched to Greek waters. The English Government learned with surprise that the French Ministers soon afterwards declined to apply coercion to the Turks, although it still professed a desire for the aggrandizement of Greece. As it had never been the intention of England to act alone, and as Austria and Germany had always taken a secondary part in the transaction, it seemed at one time either that nothing would be done, or that the Greeks would have to acquire the coveted territory by means of their own resources. A more judicious and successful period of diplomatic action coincided with Mr. GOSCHEN'S visit to Berlin. Prince BISMARCK finally consented to take the principal part in the negotiation; and the other Powers gladly followed the lead of Germany. The SULTAN was unusually deferential to a Government from which, with or without reason, he expected effective assistance. Lord SALISBURY cordially recognized the judgment and ability with which Mr. GOSCHEN discharged his difficult duties at Constantinople. Next to the German Government, the English Cabinet and the AMBASSADOR have done most to prevent war, and yet to secure to Greece great material advantage.

Lord SALISBURY concurred in Lord HOUGHTON'S opinion that the acquisition of Thessaly is probably more beneficial to Greece than the larger transfer of territory which was proposed by the Conference of Berlin. The Turkish Government is only weakened by the necessity of controlling malcontent subjects; but the greater part of the Albanian tribes, whether Christian or Mahometan, prefer their present position as nominal subjects of the SULTAN to Greek annexation. As Lord SALISBURY truly said, the Albanian element was not sufficiently taken into consideration during the earlier negotiations. Some of the tribes have since engaged in partial rebellion against the SULTAN'S authority; but it is probable that they would have resisted the occupation of their country by the Greeks. On the other hand, the majority of the inhabitants of Thessaly are Greek in language and religion; and they will have no difficulty in amalgamating with the kindred population to the South. The Wallachians settled in the province, who were supposed to claim separate national rights, have disappeared during the later stages of the controversy. The Mahometans have to content themselves with formal stipulations for the security of their persons and property. The new addition to the kingdom will form a third of the enlarged State, which now, as Lord GRANVILLE observed, nearly coincides with the limits assigned by modern historians to Continental Greece in classical times. Greek politicians will now direct their energies to the acquisition of the islands, and especially of Crete. They may probably hope that at some future time England will follow the precedent of the cession of the Ionian Islands by surrendering Cyprus to Greece. At present the title of the SULTAN, who is, as it were, the feudal superior of the island, renders impossible a transfer to any other Power. Experience must show whether the Greeks of the Kingdom are now disposed to make roads, to suppress brigandage, and generally to improve their domestic administration. Their apologists have always contended that the inadequate extent of the original kingdom explains the comparative failure of the experiment of Greek independence. The acquisition of the Ionian Islands made no change in the system of

government; but the Greeks now hold, as far as population and territory are concerned, a respectable position among minor Powers. Their commercial aptitude is conspicuous everywhere but in their own country; and it must be admitted that they have made great and successful efforts to encourage education. They may learn from Lord SALISBURY'S speech that all parties in England wish them well, and that they would be still more popular if they could become the leading State in the south-east of Europe. It is to be regretted that they should have been placed, not by their own fault, in an attitude of hostility to their Slavonic neighbours. In former times, down to the Crimean war, the Christian subjects of the Sultan were generally designated throughout Europe by the title of Greeks. The antagonism which has since arisen was due partly to novel doctrines of ethnology, and more directly to the religious schism which was ostensibly condemned and secretly promoted by General IGNATIEFF.

Lord SALISBURY, who seldom assumes the character of an optimist, has too much reason for doubting whether in the present day secondary States can in any way affect the balance of power. It is true that the great armies and the elaborate organization of modern times greatly facilitate interference with less powerful neighbours and eventual conquest. It is only by combinations among themselves that the great military Powers from time to time seek to readjust political arrangements, and petty States such as Greece and Bulgaria could not engage in war except by the permission or encouragement of powerful neighbours. Herzegovina, indeed, and Servia were employed by the Russian Government to make war on Turkey; but at the proper time they were withdrawn from the contest to make room for their formidable patron. Perhaps the most practicable method of promoting the objects of Greek ambition would be to cultivate friendly relations with Turkey. The superior acuteness of the Greeks has always given them great influence at Constantinople and in some of the Turkish provinces; and there seems to be no reason why they should not occupy more and more the highest posts in the administration. Even if their energies are confined to the limits of the kingdom, they may command the respect of Europe by setting an example of good government. It is perhaps too much to hope that they should discontinue the vicious struggle for office which causes frequent changes of Ministry and incessant squabbles and intrigues. In a country of entire social equality a democratic constitution is perhaps the only alternative of absolute government; but in itself it is not altogether desirable. The Greeks probably console themselves for their political shortcomings by the reflection that they contrast favourably with their former rulers and with other emancipated populations. There is not an English Ambassador at Athens perpetually employed in demanding the performance of covenants which are violated by chronic and intolerable misrule. Greece is also exempt from the dictation which is exercised in Bulgaria by Russian officers; and the kingdom is comparatively secure from foreign invasion.

THE FRENCH IN AFRICA.

EVENTS have moved and are moving so fast that, while we have scarcely recovered from the surprise of having to speak of the French in Tunis, we have to go much further, and to speak of the general position of France in Northern Africa. The Arabs are in revolt at Sfax, on the confines of Tripoli, and they are in revolt in South Oran, on the confines of Morocco. There is, therefore, a revolt which seems of a very determined and dangerous character at the two ends of the French dominion. A holy war has been preached, and at the outset the insurgents have had everything their own way. In Southern Algeria one French expedition has been exterminated, and another has had to retreat. BOU AMENA, a conspicuous leader of the insurgents, has ridden in triumph past a French force sent to catch him, and has dispersed or put to the sword a colony of Spaniards engaged in the cultivation of esparto grass. The survivors of the colony have fled to Spain, and have awakened much pity for their sufferings, and much indignation at the cruel neglect of the French authorities. In a debate in the French Chamber originating in an interpellation moved by three Algerian deputies, it was clearly shown that the authorities had ample warning of what was

coming, and insisted on taking no precautions. The official organs wrote in the most optimistic spirit, and while admitting that there was a little excitement among the Arabs, said it was not of the slightest importance. With cynical frankness, the Ministry owned that the accounts were cooked, and urged that it would have been absurd to agitate the public mind with tidings of difficulties in Algeria while it was being taught that the occupation of Tunis was a trifle, and would be effected without loss of life and without any serious expense. The attitude of the Chamber was decidedly hostile, and on a preliminary point there was a majority against the Government; but when M. FERRY declared that the existence of the Government was at stake, the dread of displacing a Ministry on the eve of the elections prevailed over a wish to inflict censure, however well deserved. The issue, too, was complicated by one of those cross divisions of interests which always exercise so much influence on political decisions. A brother of M. GAÉRY is the Governor of Algeria, and the attack of the Algerian members was primarily directed against him. Many Republican deputies would shrink from condemning the brother of the PRESIDENT; but this was not all. M. FERRY adroitly hinted that, if any one was in fault, it was not the GOVERNOR, but General FARRE, who alone was responsible for taking, or omitting to take, military measures. General FARRE is the staunchest of all the allies of M. GAMBETTA in the Cabinet, and M. FERRY was determined that, if he fell, the friend of M. GAMBETTA should fall with him. He was thus doubly protected, and was able to obtain a nominal victory, although his Ministry had sustained a shock which in ordinary times would have been fatal to it.

The war of the Arabs is against the French as infidels and foreigners, and they are as hostile to all infidels and foreigners as they are to the French. They forced every European who could save his life to escape by sea from Sfax, and they were as pleased to massacre Spanish colonists as Frenchmen in Oran. But the French have undertaken to put down these insurgent Arabs in provinces which are now their own, and other European nations look to them to make good their undertaking. The English Government has sent a vessel to Sfax, but it is only to help Europeans whose lives are in danger, and not to aid the French in their operations. Unfortunately for France, it can do very little at present to hurt the insurgents. Instructions have been given, and have by this time probably been carried out, to bombard Sfax; but, except as a general demonstration of French military power, this must be a wholly ineffectual proceeding. The Arabs are not likely to stay in Sfax to be bombarded, and, if Sfax is ruined as a place of trade, the loss of a petty commerce will not much affect the minds of men who are engaged in a struggle for life or death. Beyond a naval demonstration on the coast, the French can at this season do nothing. Their troops could not march under the force sun of an African summer. If they could not catch BOU AMENA in May, they have not much chance of catching him in July. For any serious operations they must wait until cooler weather sets in; and, meanwhile, the insurgents will not only be free to do as they please, but will boast of their successes, and will attract the hesitating by their boasts. In the long run, no doubt, France can put down any Arab insurrection. It is only a question of time, money, and men; but the effort necessary to put down the present insurrection may be a very serious one. Two facts also came out in the debate in the Chamber which will cause much anxiety to reflecting Frenchmen. There is a large force in Algeria, over fifty thousand men; but it is not stationed where it is wanted, and there is only a mockery of a gendarmerie. The southern parts of Algeria are not really fit for European occupation, and to hold permanent positions in burning deserts, where civilization is utterly unknown, would cause a discontent in the French army which a Government would be very reluctant to face. Then, again, after all its efforts and its self-praise, the Republic seems to be labouring under some of the defects which proved so ruinous to the Empire. The French private soldiers have behaved well wherever they have been called on in Tunis or Algeria; but there is a revival of the old complaints that the officers are sadly wanting in intelligence and obedience. It was too vehemently asserted during the debate, and the assertion has found an echo in the organ of M. GAMBETTA, that there was revealed, throughout the whole course of the recent

Algerian troubles, a paralysis of authority. No one would take responsibility, or, if any one took it, he found no one to carry out his orders. To this mischievous state of things M. GAMBETTA's mouthpiece suggests that nothing but the coming elections can put an end. The incapable Republic is to give place to a capable Republic, and France and Europe may ponder over what a capable Republic means.

Will a capable Republic, if a capable Republic such as M. GAMBETTA dreams of comes into existence, engage in a war with Turkey? If France wished to go to war with the SULTAN, a cause of quarrel might be found any day. The SULTAN is very much aggrieved by the treatment he has received from France in regard to Tunis. He has marked his displeasure by refusing an audience to the French Ambassador on his departure from Constantinople, and he has sent strong reinforcements into Tripoli. He also altogether declines to admit the pretension of France to represent in Tripoli the Tunisians, whom he still considers to be his own subjects. Nor can there be any doubt that the presence of a large Turkish force in Tripoli is a menace to the French both in Tunis and in Algeria. The insurgents are encouraged by the support which they think the COMMANDER of the FAITHFUL cannot deny them, and they preach the holy war, which they think he looks on with delight. The SULTAN has every possible right to be in Tripoli, and to keep as many troops as he likes there, and it is scarcely to be expected that the most crushed of monarchs would not turn when he was asked to consider his own subjects, being also men of his own faith, as being even in his own dominions under the protection of a foreign Power. It is not his fault that the French are in Tunis, and that he is dangerous to them in Tripoli. It is not he, but the French, who have made him an obstacle to the new French policy. But he is an obstacle, and a very grave one, and what is very important, the danger with which he menaces France is permanent. There is a logic of wrong doing as well as of right doing, and there can be no doubt that, if the French could only think of their position in Africa and forget their position in Europe, they would take Tripoli merely because they have taken Tunis. It may be added that nothing would better suit a capable Republic than a war in which it would display, develop, and consolidate its capacity—a war with a Power like Turkey, difficult enough to try its strength, and yet in which it was sure to win. The only check on the readiness of France to make war on Turkey—not this month or next, perhaps, but in a measurable distance of time—is the apprehension that such a war would bring on a general European war. A very considerable change in the situation of Europe must take place before France could reckon on taking forcible possession of Tripoli without disturbing the European concert, and France is certainly not at present ready to run the great risk of breaking the peace or truce which now prevails. But the occupation of Tunis, although not opposed by any of the Powers, has introduced a new element into European politics. Among the aims of the nominal protectors of Turkey, there is now a new piece of plunder which one of these protectors means to have; and this gives a forecast of a possible future which it would be idle to disregard.

THE BUSINESS OF THE HOUSE OF COMMONS.

MR. GLADSTONE complied with established custom in reserving one or two Government measures from the inevitable abandonment which he announced to the House of Commons. For many years the Prime Minister of the time has about the same period of the Session been obliged to make a similar statement, and it is always understood that his list of the measures which are still conventionally supposed to survive is not final. On the next occasion Mr. GLADSTONE will be compelled to surrender the Bankruptcy Bill, which indeed only interests a limited class. The House will have spent seven months in elaborating a single Bill and certain executive measures with which it was supposed to have a connexion. The Land Bill, in its final shape, will be the result of many divisions, and also of much unwilling acquiescence. No legislative scheme has been so cordially disapproved by a large section of its supporters, as well as by the hesitating opponents who thought that too prolonged a resistance might be injurious to the interests of the country. If the Bill proves in accordance with general expectation to

be mischievous in operation as it is vicious in principle, the minority will not share the blame of a false policy because they submitted to necessity. There might have been no need of a Land Bill if the Government had held to the resolution which, according to the Duke of ARGYLL, had been originally formed, of awaiting further experience of the working of the Act of 1870. Legislation only became inevitable because it was offered by the Government, after the failure of the miserable device of an extemporaneous Disturbance Bill.

The struggle within the Cabinet, which occupied the autumn and early winter, was principally important because it was certain that the measure which might result from the Ministerial deliberations would thenceforth become the low-water or minimum line of change and spoliation. It is still believed that Mr. GLADSTONE long inclined to comparatively moderate proposals, though he afterwards yielded to the more thoroughgoing opinions of some of his colleagues. The Bill was found to embody the three demands which had been most urgently advanced on behalf of the Irish tenants. Prudent politicians perceived, that, unless the Government could be induced to retract some of its concessions, a less revolutionary change was no longer possible. The apologists of the Government had some ground for taunting the Opposition with the certainty that, if it could have displaced the Ministers, a Conservative Government would have been compelled to introduce an equally comprehensive Land Bill. It is allowable to recognize the inevitable character of a course of policy, without acquitting those who had made it necessary. There is no use in defending a pass which has once been turned. One of the most zealous advocates of the Bill makes, on the part of England and Scotland, the plausible demand that the Irish shall be satisfied for a series of years with a measure which has rendered all other legislation impossible. The claim may be reasonable; but there are no means by which it can be effectually asserted. It is nearly certain that the hopes which have been excited, and the disappointments which must occur, will at shorter and shorter intervals revive fresh agitation and appeals to Parliament. It would be well if other portions of the United Kingdom were secure against the application of a precedent now established on the pretext that exceptional measures are required by the peculiar condition of Ireland.

The interruption of legislative activity is not an un-mixed evil. The list of twenty or thirty neglected measures which Mr. GLADSTONE included in one of his indictments against the late Government would leave few existing institutions untouched. It was, on the whole, desirable that a Parliament elected under the influence of clamour and violent rhetoric should wait before it tried its energies in destructive legislation. The English Land Bill, when it is hereafter produced, will probably reflect democratic passions less completely than if it had been produced immediately after the Midlothian speeches and the general election. The appetite for change will no longer be stimulated by the artificial association of wild agrarian theories with the misdeeds of the Turks or with the disasters of the Zulu and Afghan wars. The dis-establishment of the Church has, with the general consent of the party of innovation, been reserved for a future Parliament to be elected by a more numerous and less competent constituency. The postponement for one or two Sessions of household suffrage and of redistribution is unimportant. The democratic managers will assuredly not allow their majority to separate without largely increasing their own influence by electoral changes. The adjournment of the measure will but slightly mitigate its evil consequences by allowing moderate and capable members to be returned by the present constituencies at by-elections; and in some places short-sighted farmers are disposed before they are practically disfranchised to associate themselves with the policy which is most adverse to their interests. It is possible that the destruction of the administrative functions of justices in counties may stand over till after the next election. It is something to retain for a time a system which has worked remarkably well. The late Government was much to blame for not reforming county administration on modern principles. The task was, as in many similar cases, left to be performed by the opposite party, which would legislate with the object of diminishing the influence of property in favour of the numerical majority.

The Bills which the Government have been compelled

to withdraw are of secondary importance. The Bankruptcy Bill, though it seems to have been generally approved by those who understand the subject, may perhaps be presented to Parliament in a still more complete form after further consideration. The much more important measure for the reform of criminal law and procedure had at the beginning of the Session been once more indefinitely postponed. It was probably not without regret that Mr. GLADSTONE relinquished the hope of passing the Parliamentary Oaths Bill, with the consequence of a revival of a disagreeable personal complication. Even those who agree in opinion with the Ministers are probably satisfied of the impossibility of passing at the end of the Session a measure which excites so much strong and angry feeling. The Corrupt Practices Bill is not at present urgent, as there is no prospect of a general election. It was, on the whole, well that a measure which derived its origin from a feeling of legitimate moral indignation should be reserved for a time of calmer reflection. The inquiries prosecuted by the Election Commissioners showed that in several boroughs, almost casually selected, a considerable portion of the constituency was ready to accept bribes on one side or on both; and that persons of good position and of local influence had no scruple in aiding the process of corruption. There can be but one opinion as to the expediency of creating or fostering a sounder electoral morality, if improvement can be effected by legislation; but it may be doubted whether the ATTORNEY-GENERAL is well advised in relying on severity of punishment. Long experience has shown the difficulty of enforcing penalties which are popularly regarded as harsh and excessive. That bribery should be considered a venial offence is both an error and a misfortune; but a moderate increase in the severity of punishment would perhaps be the most effectual mode of discouraging the offence. It is for political moralists rather than for Law Officers to examine the causes of electoral corruption, and the indications which it affords of the competence of different classes of voters. A constituency which is only deterred from giving or receiving bribes by a severe criminal code is not a satisfactory element in a representative system. It may well happen that the demagogue is the alternative of the lavish election agent, or that, as in the United States, corruption may be transferred from the voter to the professional manager of political clubs and organizations. It happens to be necessary to ask for a temporary renewal of the Ballot Act, which has unexpectedly failed to prevent the distribution of bribes. The process of secret voting is open to more than negative objections; but, like other democratic innovations, it is in its nature irrevocable when it has once been established. It was but a barren consolation to the opponents of the Ballot that they were strong enough to substitute an ostensibly experimental enactment for final legislation. It may be confidently assumed that no Parliament elected under the Ballot will at any time recur to open voting. In the present Session all parties will concur in the expediency of a temporary renewal of a measure which is destined to be permanent. If the measures which are abandoned excite no keen regret, the consequences of the mode in which the Session has been spent may too probably be both injurious and permanent. The proceedings of Parliament have never been so tedious or uninteresting. There has been scarcely any room for the legitimate ambition of members, with the exception of the comparatively small body which devoted itself to the elaboration of the Land Bill. The House of Commons has not only almost discontinued the exercise of its legislative functions; it has also in great measure renounced the supervision of domestic and foreign policy. After many weeks Mr. GLADSTONE has not found time for the promised discussion on the affairs of the Transvaal.

CENTRAL ASIAN AFFAIRS.

THE ingenuity of those who maintain that the Candahar division was not obtained on pretences practically false; that the assurances of Russia, direct and indirect, in reference to her Central Asian policy have been thoroughly carried out; and that all is well for England between the Caspian and the Hindu Koosh, has been once more put to a severe test. The adventurous Correspondent of the *Daily News*, who has for many months enabled Russian official bulletins and the thrice-filtered gossip of Tiflis, St. Petersburg, and Berlin to be

corrected by authentic intelligence, is, it may be remembered, a prisoner at Merv. He does not seem to be kept in severe durance, and his captivity allows him to send occasional messages home; though the Turcomans, either regarding him as a useful hostage, or simply anxious for a ransom, do not appear to be in any hurry to let him go. His last message is dated June 22, and it contains two very important statements. The first is that the annexation of the delta of the Upper Atrek, long coveted by Russian military geographers of the stamp of the late General PETRUSEVITCH, has been formally effected. The other is that constant negotiations are going on on the part of the Russian Commandant at Askabad with the view of inducing the inhabitants of Merv to throw themselves into the arms of Russia. The great inducement offered, according to the Correspondent, is a promise that "their territory will be respected, and the further Russian march eastward will be made *via* Meshed." Vague as is the knowledge which many Englishmen (including, it would appear, a majority of the House of Commons) possess of Central Asian affairs, the words "further advance eastward," and the news of a substantial encroachment, not on the Turcomans, but on Persia, can hardly be misunderstood by any one, though their full import may probably not be comprehended. The defenders of the Government policy in the East—that is to say, the *Pall Mall Gazette*; for the *Daily News*, while persistently affirming that Russia is not dangerous in that quarter, fully admits the awkward appearance of her recent acts and words taken together—have been somewhat hard put to it for comment. The *Pall Mall Gazette* thinks it certainly for the good of the annexed districts that they should be annexed. The rest of the news it endeavours to dismiss by a somewhat rueful admission that Meshed will now be substituted for Merv as a subject of alarmist fears.

The apparent inference is certainly ingenious. That inference, which very likely the writer did not fully perceive or intend, is that Merv is as little dangerous as Meshed, and Meshed as little dangerous as Merv. With a sufficient ignorance of history and geography, this impression might be produced and maintained. The merest glance at a tolerably good map will show its fallaciousness. It was just possible for a fervent believer in Russia to argue that her presence at Merv was quite natural, reasonable, and right. Merv was the centre of the Turcoman power, the headquarters of the enemies of caravans, the capital of the last independent portion of Turkestan. Its acquisition would completely round off the Russian frontier, would guarantee the safety of trade, would provide an alternative route to Samarkand. All this was perfectly true, though it was but a very small portion of the truth. It is possible, provided there is no objection to deserts and roundabout roads, to go eastward from Merv and by Merv to territory which is already Russian. Now it is not possible to go eastward through Meshed to any territory which answers this description, without passing through Merv also, which would make the Russian promise an absurdity. As an alternative to Merv, Meshed leads not to Turkestan, nor even to what is called Afghan Turkestan, but simply and solely to Afghanistan proper. It would be sufficient to say that the mere contemplation of a further eastern advance is a violation of the undertaking given at the Czar's accession, even if that advance merely tended towards the securing of the last corner of free ground in Turkestan. But the words used exclude this construction. The Russians will not go to that corner; they say they will not even go through it. That being the case, there is no place left for them to go to except the very place which Liberal not less than Conservative opinion declares not merely to be forbidden ground to Russian troops, but to be outside the zone of Russian influence and operations altogether.

Meanwhile there is the accomplished fact of the annexation on the Atrek. The meaning of that annexation is more than that of a new encroachment on Persian territory, undoubted as that encroachment is, for even PETRUSEVITCH himself allowed that the Persian frontier passed to the north of Kuchan, which, we are told, is included in the new rectification of frontier. It is not merely an assumption of a piece of somebody else's property, but an assumption of a very particular piece of some one else's property. To understand this it must be remembered that the road through Akhal and Merv, or even through Akhal without going to Merv, is by no means the best or shortest from the Caspian to Herat and India. It is the only one

which could be taken without violating Persian territory; and the country through which it passes offers a valuable supply of hardy soldiers, but it is long and ill provided. The best way is by Meshed (the way which the Askabad diplomatist proposes); and even then there are alternative routes from Astrabad, or any other point of departure at the south-eastern angle of the Caspian. The shortest of these is the more southerly by Shahrood. This was taken by the *Daily News* Correspondent on the very journey which took him to Merv. But this way has the drawback of trenching too closely (though there is a third little-used road which trenches still more closely) on the great desert which forms the kernel of Persia. The best way, therefore, for an army which has to be fed as well as to move is through the Attrek country, keeping from Tchikisar tolerably close to the river the whole way, but from Astrabad touching it only in the middle of the journey from Budjuurd to Kuchan. It is precisely this middle part of the way which the Russians have now either actually annexed or completely commanded by their new annexation. Their work is not quite complete, for to the east of these rectifications there is much fertile and useful country in the districts of which Derogoz or Mahmudabad, and Sarakhs, are respectively the centres. But even Russian annexation must proceed with due gradations, especially when assurances have just been given that there is to be no proceeding at all. On the whole the progress announced is quite sufficient to put it into the power of General SKOBLEFF's enterprising and ingenious successor to make his "further advance eastward" by Meshed, and to fulfil the tempting promises he has made to the Turcomans without the slightest difficulty.

There is probably very little hope of inducing those who see all things merely in Mr. GLADSTONE to draw the obvious conclusions from these facts. But it is not the less the duty of every one who is in a position to do so, to give these persons an occasional opportunity of drawing such conclusions. If any one chooses boldly to say that the Turcomans are thieves, that Persia is impotent, and that the sooner Russians and English are fairly face to face on opposite sides of Afghanistan the better, he may claim at least that he reasons with courage, and does not absolutely ignore facts. But if any one attempts to argue that the present state of things does not mean such a confronting of the two Powers within a very short period, he must choose between a conviction for wilful blindness and a conviction for incapacity to form an opinion. We are not, for the present, arguing the advantages or disadvantages of having Afghanistan, and Afghanistan only, as a separating zone, with the Russian road to the edge of that zone easy and well furnished with all things necessary for a great army. What is necessary is to point out, as often as a new step is taken, that this state of things is imminent, and that it has to be considered how it is to be dealt with. To lament over the sad discrepancy between the golden words of the newly-enthroned Czar and the iron deeds of his rude generals is quite superfluous. It is useless to talk about words; and nobody—nobody, at least, who was acquainted with the subject and not pledged to radical theories as to English foreign policy—was ignorant of the probability or of the consequences of the deeds. It has been said before, and must be said again, that a Russian invasion of India may be the certain disaster for Russia which some people assert it to be or that it may not, but that the arrangements for facilitating that invasion are, to all appearance, being carried on with a rapidity and a success to which it would not be easy to find a parallel.

THE FRENCH EDUCATION BILL.

THE French Senate has made a change in the Compulsory Education Bill which is likely to wreck the measure for the Session. The introduction of compulsion had been made the plea for a complete disestablishment of religion in elementary schools. If parents are to be forced to send their children to school, liberty of conscience demands, in the opinion of the Government and of the majority of the Chamber of Deputies, that the school shall be absolutely neutral ground as regards religious teaching. The Protestant or the Atheist must be under no uneasiness as to the possible infiltration of Roman Catholic doctrines into his child's mind. Consequently the teacher was directed by the Bill as it left the Chamber

of Deputies to teach morality as part of the school course, but to make no reference to religion. The child of the Protestant must hear nothing to shake his Protestantism; the child of the Atheist must hear nothing to shake his Atheism. The example of England was frequently quoted in support of this process of "laicization." It is possible that this blunder, strange as it seems to us, was perfectly genuine. There is nothing, or next to nothing, in France of that vague belief which contentedly finds expression in the permission given to teach the Bible in School Board schools, provided that it be not interpreted in the sense of any particular denomination. Such a compromise is only possible in a Protestant country. In Catholic countries the distinctions between confessions are more sharply defined, and religious teaching means the teaching of Catholicism or of some specific variety of Protestantism. Even had the resemblance between the two experiments been much closer than it actually is, the circumstances under which they are severally tried are too different to allow of any useful comparison. The exclusion of religion from School Board schools might have been much more thoroughgoing than it is without the injury done to religious teaching being nearly so great as that which the French Compulsory Education Bill promised to do. In England voluntary schools are numerous and well supported; in France they can hardly be said to exist. In spite of the occasional disposition of School Boards to claim a larger sphere for themselves, the place which they really have to fill is that of a supplement to voluntary schools. When the Education Act of 1870 was under discussion, there was a general and, as it seemed, well-founded fear lest the formation of School Boards should drive the voluntary schools out of the field. The event has shown how wholly groundless this belief was. In 1880 there were more voluntary schools and more children attending them than there had been ten years earlier. If the School Boards all over the country were to give no religious instruction for the future, only a few religiously disposed parents would be sufferers by the new law. The great majority would find in the neighbouring voluntary schools all that they wanted in the way of direct denominational teaching. In France religion, if it be included in the ordinary elementary studies, must be taught in the communal schools. If a parent is dissatisfied with the absence of religion from the school course, he cannot ordinarily take his child away and send him to a school which he likes better.

These circumstances seemed to suggest the application of what is known in this country as a conscience clause, and to introduce this was the object of an amendment which was warmly supported in the Senate. The Duke DE BROGLIE on the first reading, and M. OSCAR DE VALLÉE on the second reading, proposed that the elementary instruction given in communal schools should include the teaching of religion, except in cases where the parents of the children object to such teaching. The Senate rejected this amendment on both occasions, and the defeated party then turned their thoughts to the better definition of the moral teaching which the Bill directed should be given as part of the school course. M. DELSOL proposed that the morality taught should be religious morality. What would have been the fate of this amendment will never be known; for a speech from M. FERRY, and the use made of it by M. JULES SIMON, prevented the Senate from voting on it. The PRIME MINISTER opposed the insertion of the word "religious" on the plea that the eternal morality is a morality *sans épithète*, and that to define it would only be to narrow it. The morality which the Bill proposed to teach in communal schools was the essence which underlies evolutionist morality, utilitarian morality, positivist morality, independent morality. It was the morality alike of Mr. SPENCER, of KANT, and of M. JULES SIMON. At this point M. FERRY was challenged to say whether this was a morality suited to children; whereupon he substituted another definition of morality, and identified it with the precepts which we have learned from our fathers and mothers—for example, "Do unto others as you would they should do unto you." The Right at once objected that this is a commandment of God, and therefore is included in the prohibition of religious morality. M. FERRY replied that it was not forbidden to speak of the commandments of God, and was then asked by the Duke DE BROGLIE whether the teacher might speak of God, and by M. BUFFET whether he might speak of duties to God. To this M. FERRY answered,

sensibly enough, that France was still in the main a nation of Theists, and so long as the majority alike of parents and teachers remained Theists, the morality taught in the communal schools would be a morality founded on Theism. What he disliked was the phrase "religious morality." He objected to it because it was unintelligible, and in support of this view he appealed to M. JULES SIMON, who had frequently said the same thing.

It was not long before M. FERRY had good cause to repent that he had helped to provide M. SIMON with an excuse for speaking. The Philosopher began by expressing his pleasure at finding himself so nearly in agreement with the PRIME MINISTER. All that M. FERRY had said about morality he could heartily accept if it was confined to the teaching of morality in the University. Still for children something simpler was wanted than either KANT or SPENCER; Frenchmen do not desire to have their children taught a morality founded on utility or pleasure, a morality without God. Unfortunately, however, a suspicion has grown up that there is a disposition in the Republican party to set up schools from which God will be shut out. M. FERRY, it is true, protests that the Republicans have no such intention; but then M. FERRY is a Minister, and Ministers are the most fragile and transitory of created things. Anyhow, it is not well for the Republican party to be accused of Atheism without taking some step to rebut the charge. "If you dislike the phrase religious morality, you are not afraid, I suppose, of the name of God; and in that case why not insert a paragraph directing the teachers in communal schools 'to teach the children their duties to God and to their country?'" M. DELSOL at once withdrew his amendment in favour of M. SIMON's suggestion, and the debate was adjourned. On Monday the unlucky PRIME MINISTER had to explain away what he had said on the Saturday. Ardent Theist though he was, he was still convinced of the impossibility of directing schoolmasters to teach children their duty towards God, because to do so would raise the question whether the law meant the God of the Christians, the God of SPINOZA, that of DESCARTES, or that of MALEBRANCHE. M. SIMON defended his amendment in a speech which seems to have been one of his best. He insisted that, unless Republicans wished the communal schools to be neutral ground between Theists and Atheists, they ought to make it clear that they meant Theism to be taught in them; and a minority of the party, strong enough to determine the action of the Senate, were of the same opinion.

The indignation of the Extreme Left has been extreme, but it has only incidentally been directed against M. SIMON. M. FERRY is accused of having provoked his defeat by his anxiety to rebut the accusation of Atheism. If he had defended what one of their organs calls "the rights of children" mutilated by a hateful encroachment upon the domain of "conscience," he would at least have been defeated honourably. The conclusion of M. CLÉMENTEAU's paper is that nothing better was to be expected of a man who could disgrace himself in the Senate by avowing his belief in a God. M. FERRY's defeat will not affect his position as Minister, since he is maintained in that for reasons which have not lost their force, but it will not improve his reputation as a Parliamentary tactician.

THE LIBERAL PARTY IN EUROPE.

THE Liberal party is in the ascendent in almost every European country. Russia must be excluded, as in Russia there are no parties at all in the ordinary sense of the term. There is merely despotism on the one hand, and revolution on the other. In Germany Prince BISMARCK has quarrelled with his old Liberal friends, and has sought to secure a new basis of support in an alliance between Conservatism and Socialism. But the Parliament which has just come to the end of its term cut down or rejected his Socialist schemes; and, while he has openly quarrelled with the Liberals, he has not thought it worth while to purchase the favour of their adversaries by any substantial concessions. In Austria there is a Ministry of conciliation which does not conciliate, but exists, which can do little in any direction, and is now engaged in suppressing Czech riots in the capital of the Czechs. The Hungarian elections have confirmed and increased the Liberal majority, and the existence of a Liberal majority in Hungary means that Hungary will work with Austria so long as Austria leaves Hungary an abundance of local freedom, and pursues a

general policy to which Hungary cannot reasonably object. In Italy no Ministry except a Ministry of the Left can be formed, although Signor SELLAI, when asked to take office, placed before those whom he invited to join him a programme in which very advanced Liberals honestly owned that they saw nothing to which they could object. As France is just about to celebrate again the national fête of the taking of the Bastille, it is useless to speak of the position of the Liberal party there. The taking of the Bastille has become a symbol on the Continent of popular, as distinguished from monarchical, Liberalism. Of the minor States, Spain has lately come under a Liberal Ministry, because the KING thought the time had come when a Liberal Ministry ought to be tried, and the people were at first indifferent to and then pleased with the experiment. Liberal Ministries just hold their own, although they barely hold it, in Belgium and Holland; while in Denmark there is a languid but eternal quarrel, the Crown refusing to take Liberal advisers, and the electors sending representatives who will not vote supplies. Whether in more backward States, like Rumania or Portugal, there happens or does not happen to be in office a Liberal Ministry, is a matter of the smallest possible importance, as one Ministry is exactly like another, and every Ministry is the offspring of some local intrigue. Still even in such countries there are scarcely any exceptions to the general rule, and it may be said broadly that outside Russia, which is not really a part of Europe, the Liberal party governs throughout Europe, with the exception of Prince BISMARCK's recent coquetting with Conservative Socialism.

If it is asked what in this triumph of the Liberal party is triumphing, what are the principles on which the party is agreed, and what are the aims towards which it is striving, it is astonishing how many of the old aspirations of the Liberals, as we used to know them, have sunk into desuetude. To begin with, there is now not the slightest anti-monarchical feeling. There is hardly a king among the monarchs of Europe who is not exceedingly popular with his subjects; and, to the credit of royalty, it may be added that there is scarcely a monarch who does not deserve his popularity. In France there is a Republic, but it is not a Republic of the kind that tries to convert its neighbours; and the Republic of France is quite as much a protest against the last French monarchy, with its very peculiar habits and surroundings, as an expression of deep and abiding prepossession. Then the old Liberal feeling in favour of peace has faded away. No European country wants war, for all have learnt or seen what war means. They are afraid of war, but they are still more afraid of being without the means of making war. Gigantic armies and a modest proportion of iron-clads are demanded with as much fervour by Liberals as by any one else. The first thought of every French Republican who comes to the top is to shout, and if possible to prove, that the Republic is the true friend of the army, and the "heroism of our young soldiers" is eagerly seized on as a splendid testimony to the great truth that the sons of French peasants can march and fight, although there is no Emperor to review them, and no Empress to smile on them. Under the influence of this supreme desire for military strength, the old Liberal faith in political economy has dwindled away until it hardly exists as the ghost of a tradition. In France, in Italy, and in Spain there is now no connexion whatever between Liberalism and Free-trade, and a man may be the staunchest of Liberals and see no inconsistency if at the same time he has as his sole thought on finance how he is to get an increased duty put on some foreign article that rivals the production of himself or his friends. It is true that the Liberal party in Europe has one strong feeling which unites it, and that is a horror of aggressive Socialism. But, in the first place, this is a new feeling, and, in the next place, it is shared by their opponents. There remain as distinctive principles and abiding motives of the party some kind, and often a very theoretical kind, of tenderness for personal liberty, some prepossession in favour of the liberty to express opinion, and a resolution to oppose the pretensions of the Roman Church.

History and the habits of the people give a very different colour to the Liberalism of Liberal countries. Some may be described as approaching more nearly to the English and others to the French type; and for the moment it may be said that the mark of distinction is generally to be found in the quality of the suffrage. In

every country Liberals have to face the perplexing question how they can defend a restricted suffrage and how they can afford an unrestricted suffrage. In France there is universal suffrage, and the peasants at present support the Republic; but they make it a condition of their support that the Republic shall give them material prosperity, and that it shall secure this prosperity by adopting the machinery of Protection, which they think is the only sure guarantee of national well-being. In Germany Prince BISMARCK, in order to avoid troublesome questions of electoral reform, bestowed universal suffrage on the infant Empire; but he calculated, and he now proposes to show that he calculated rightly, that, with the influence of a military State at his command, he could use universal suffrage to repress the Liberal party. In other countries Liberals are aware that, if every man were allowed to vote, they and their party might be swept away altogether. Yet it is so difficult to defend any restriction except on the ground that it exists, and that those who do not like it must make the best of it, that there will always be Liberals who urge that every one ought to be allowed to vote. A Liberal of this kind lately proposed to the Brussels Chamber that every Belgian who could satisfy very easy tests of residence and education should have the right to vote, on which the MINISTER OF FINANCE plainly told him that, if his proposal were carried, there would be an end not only to the Ministry, but to the Liberal party in Belgium. A measure of electoral reform has been talked of for years in Italy, and this Session a Bill for a very extensive reform has passed the Chamber, and is before the Senate. Italians of all parties allow that the present franchise is too restricted; but they all find it very difficult to draw a line which shall be intelligible and permanent. The Chamber rejected, by a majority of 10 to 1, a proposal for establishing universal suffrage pure and simple, and it decided, without much difficulty, that it would adopt an educational test. But what this test should be was a matter on which opinions differed greatly. The Government proposed that the voter should have attended a primary obligatory school; the Committee appointed to report on the Bill thought this too lax, and required that voters should have reached the Fourth Standard; and, finally, when it was pointed out that there were grown men who could not have been at schools, as in their days there were no schools for them to go to, the Chamber decided that, as a temporary measure, until the school test could be applied, every one should vote who could write and read. The real difficulty was how to admit as many as possible, and how to keep out the ignorant mass who might be under the influence of the Church. Liberal Italy, like Liberal Belgium, has to think how an extended suffrage may affect its existence. In other countries an extended suffrage may not sweep away the Liberal party, it may even increase its nominal strength; but it may transform the party it strengthens, and bury the old watchwords in an even deeper oblivion than overshadows them at present.

FRIENDLY SOCIETIES.

AT this time of year many people have to make speeches at the annual dinners of Friendly Societies. When the proper amount of heavy joints have been eaten and the proper number of quarts of beer have been drunk, the chairman of the day rises to make such remarks as occur to him upon the state of the Society's finances. The Registrar of Friendly Societies has lately published a memorandum which will be extremely useful to speakers in want of a suggestive text. Under the Act of 1875 all registered Friendly Societies are required to make a return of their assets and liabilities every five years. The first of these returns ought to have been ready by the 31st of December, 1880, and in the case of a great many Societies the law has been obeyed. Obedience, however, is still very far from being universal, and the object of the Registrar's pamphlet is to make it universal without having recourse to the legal powers with which the Act of 1875 has armed him. With this view he sets out the reasons why such a valuation is required, and impresses upon the Executive of the several Societies the importance of having it made by a competent person. Under both these heads much useful information is given, and the gentry who attend the dinners in question may do their humble neighbours a real service by repeating to them what the

Registrar has said. It must be admitted that to suggest this is to ask them to be a little dull; but the flavour of a chairman's humour is seldom fine enough to make the sacrifice a serious one. The effect of such hints as can be conveyed in an after-dinner speech is no doubt extremely indirect. It is not the members who are present who really decide whether returns shall be made or who shall be appointed to make them. They usually do but elect a secretary or a delegate, who has merely a single vote in the election of the central executive by which the affairs of the Society are managed. But if the same warnings are given in many branches of many Societies, something may be done towards creating an effective public opinion in favour of accurate valuation. If many secretaries go up to the general meeting instructed by their constituents to impress upon the executive the necessity of honestly complying with the law, there will be at least a chance that readiness to comply with it will become a test question at the annual election of officers. It is not, we fancy, the rank and file of these Societies that are most to blame in the matter. Every village has its tale of an insolvent "club," which, after lasting through the years when the chief thing to be done was to receive contributions, has come to nothing when the time arrived for distributing benefits. It is a serious thing to a labouring man to find that, after paying his money steadily while he was young and healthy, there is nothing to be had in return when he is old and sickly. Newer and more promising Societies will not receive him as a member, or will only do so on terms which put him on a level with the careless neighbour who has never thought of joining a Friendly Society until the need for the benefits secured by it is becoming apparent. A disaster of this kind is very well calculated to make the members of Friendly Societies uneasy lest a similar fate should be in store for them. But the officers of such Societies not infrequently approach the facts in a different temper. They also may suspect that things are not going right, and that a full and impartial examination of the Society's position would supply some justification for the members' fears. But they are busy in the conduct of the Society's affairs; they have the hopes which are seldom wanting to men thus employed; and they are afraid that to tell the truth may be to make a disaster inevitable which, without such a disclosure, may still be staved off. Parliament has so far interfered to guard the members of Friendly Societies against their executive that it has made the presentation of valuation returns a condition of registration. If a Society wishes to keep its affairs in a condition of convenient obscurity, it is free to do so. But in that case it will not be registered. It may prey upon the public as it chooses, provided that it does not bring itself within the grasp of criminal law; but it must not prey upon them in the character of a Society which enjoys Government recognition. Most people who live in the country have some opportunities of impressing upon their poor neighbours the superiority of a registered over a non-registered Society, and of a registered Society which carries out the spirit of the Act of Parliament over one which is content with rendering obedience to the letter, or has to be taken before a magistrate before it will do even so much as that. They can hardly do these neighbours a more useful service than by using any influence they may possess to bring these facts home to them.

The Registrar's Memorandum puts the necessity of periodical valuation in a way which can hardly fail to commend itself to the members of Friendly Societies. Every such Society promises to give specific benefits in exchange for specific contributions. The certainty of reaping the benefits depends upon the adequacy of the contributions. It is from the contributions that the benefits must be paid; and, if the contributions are inadequate to provide the benefits, the Society will not be able to keep its promises, and must become wholly or partially bankrupt. A Society may have money in hand and yet be insolvent; it may have more money in hand at the end of one year than it had the year before, and yet it may not be prosperous. Solvency depends not on an accidental and momentary preponderance of receipts over liabilities, but "upon whether its existing funds, together with the future contributions for benefits which the members are bound to pay, are enough to balance the benefits which those members have the right to receive under the rules, together with any other expenses and liabilities." Everything, therefore,

depends upon the proper proportion between benefits and contributions being strictly maintained. "If the money a man is paying is not enough to secure him the benefits which he relies on, what is the use of paying it?" This is a question which many a member of a Friendly Society has asked in the past tense; but the Registrar's object is to make them ask it in the present and future tenses. The longer they go on making payments which are not enough to secure them the benefits promised in return, the worse it will be for them in the end. Of course they may fall ill and die before the state of the Society's exchequer has been discovered, and in that case it may be better for them not to have left it. But, except where a man has good reason to think that, short as the Society's lease of life may be, his own will be still shorter, the sooner he gets out of a Society with which insolvency is only a question of time the better. Every year that he remains a member makes it more difficult for him to join a Society constituted on a sounder footing, and adds to the probability that, when he really wants the help he has all his life been paying for, it will not be forthcoming.

We do not propose that the chairman at a Friendly Society's dinner shall urge the members to lose no time in leaving it. If he has satisfied himself that it is in danger of bankruptcy, he will do better to stay away altogether. But, though when he has been asked to bless he cannot with decency curse, he may still counsel the members to satisfy themselves that the Society is in a position to keep its promises. They have no business to be satisfied on this point unless there has been a proper valuation of the funds coming or to come into the Society's treasury and of the liabilities which these funds will have to meet. Unfortunately the Act of 1875 does not, as we have often pointed out, insist on this comparison's being made by a person competent to make it. The Chairman's next business, therefore, will be to show how much depends upon the technical knowledge of the valuer, and how essential it is that the valuer chosen should possess this technical knowledge. The Registrar's Memorandum will tell him what is proper evidence of competence, and if he can induce his hearers to ask the executive of the Society not to be content with any less perfect proof, he may have started a movement which will bear useful fruit by and by.

THE AMERICAN CRIME.

WHEN the virtuous Herr Most, in the article which won him the sympathy of intelligent Radicals, was calling for all "threatened heads," he specially mentioned the heads in Constantinople and Washington. A Sultan cannot be murdered every day, even to oblige Herr Most, but his advice has been rapidly followed in Washington. The theory that every person in authority is a *caput lupinum*, an outlaw *ex officio*, has been acted on by Mr. Charles Guiteau, who describes himself as a Chicago lawyer and a "Stalwart of the Stalwarts." There seems reason now to hope that his cruel and abominable action will not help the Stalwarts or remove a statesman who has borne his sufferings with extraordinary constancy and courage. President Garfield has won the sympathy of the whole world. His political opponents have lost ground in proportion, and though it is probable that only fanatical party hatred and furious indignation could charge them with any knowledge of Guiteau's crime, they are almost as much discredited by it as if they had really instigated the offence.

The attempt to assassinate President Garfield was an offence peculiarly American in character and in detail. Mr. Browning has written a poem on "Nationality in Drinks," and there appears to be such a thing as nationality in crime. A Russian murderer is usually the half-witted agent of a secret society. He is provided with all scientific apparatus for accomplishing his misdeed; and he is careless as to the number of lives of unoffending people he may destroy in addition to the crowned head at which he especially aims. He usually has confederates among ladies of birth and education, and attempts are made to secure his retreat. His position is that of a political agitator, using what he conceives to be the only possible means of political agitation. An Irish villain is a more clumsy, more cowardly, and more harum-scarum malefactor. He aims to do mischief at large, as part of the process which the Jacobites called "boxing it about." He is unscientific in his choice of implements; he runs away as soon as he is detected; and he ingenuously avows his regret that he ever took part in the undertaking.

The American assassin seems not to act as the agent of any society, and; he has no thought of regenerating the human race, like the Russian, or of annoying a hostile and masterful people, like the Irishman. He merely works out the simple American

principle, "the spoils to the victor." He regards politics as a system for the distribution of jobs and patronage; and, when his own friends, the "Stalwarts," have not patronage at their disposal, he tries to secure it for them with the aid of a "California bull-doser." The "Bull-doser" is a much more certain weapon than the Russian bomb, or the Irish gas-pipe or wooden box charged with gunpowder, brown paper, and an old carpet-bag. A "bull-dose" means a large efficient dose of any sort of medicine or punishment. To "bull-dose" a negro in the Southern States means to flog him to death, or nearly to death. Thus a California bull-doser is a pistol which carries a bullet heavy enough to destroy human life with certainty. It was with this weapon that Guiteau proposed to rectify the balance of patronage.

The sanity of Guiteau is a question which will interest experts, but which the people of the United States are not likely to consider too curiously. That Guiteau was constantly pestering General Grant and other persons for every post from the Austrian mission to a consulship at Marseilles does not prove him to be insane. If it did, an American President must every day enjoy large opportunities for studying the phenomena of lunacy. To a very great number of American citizens politics are as much a profession as the directorship of railways, companies, and Indian gold mines in England. The July number of the *North American Review* contains an article on "The Power of Public Plunder," by Mr. Parton, which will explain to English readers the nature of "the boss business." Mr. Parton's text is the short speech made by Mr. O'Phanagan at a convention in Chicago last year, "What are we here for if not for the offices?" Mr. Parton says, "We are face to face with a state of politics of which money is the motive, the means, and the end." Politics, in fact, are "a big gamble," and Mr. Guiteau is one of the gamblers who have found themselves backing the losing colour. Mr. Parton likens people of the Guiteau class to flies on a wharf, rats in a cheese ship, and the hideous things that crawl in the ooze of a slaughter-house. One of those persons declined a place of which the salary was but fifty dollars a week, because that sum would not pay for his rum and cigars. In the recent presidential election people are said to have made money by the million. Guiteau was a speculator who had mistaken his market. His friends, the Stalwarts, found that their man was put off with the position of Vice-President, and that the President himself was not only not their friend, but the enemy of all corruption and jobbery. Guiteau himself need no more be a maniac than the equally celebrated Lefroy, who did a good deal of work on the Liberal side during the general election. If Lefroy had cherished the belief that the result of the elections would have been to enable him to pick and choose among offices and salaries, his disappointment might have led to results like those which America deploras. But a political "worker" in England knows that his gains are limited to a few casual sovereigns and a little beer. In America a vain and selfish man may hope for something immeasurably better, and his disappointment when he fails is proportionate. The despair and envy of the ruined gambler take possession of him, and despair and envy are likely to prompt to villany.

The letters and papers which Guiteau had prepared may be genuine documents, or he may have intended to prepare evidence of his own lunacy and moral irresponsibility. However that may be, they are conceived in the true spirit of the modern political assassin. He contemplates his crime as a mere incident in the political evolution. He looks at it as impersonally as if it were an operation of nature, a landslip, or a flood, which we may regret, but which is outside moral praise or blame. He even attempts, in one paper, to pretend that his real care was, not for the pockets of the Stalwarts, but for the Republic at large. One might imagine that, when politics became a pure affair of commerce, political fanaticism would cease to exist. When it was understood that every politician was going merely for the dollars, no one could pretend to be inspired to crime by watchwords, like Liberty and the State. A speculator in Wall Street might as well pretend to shoot some more successful business man for being a tyrant and the natural foe of freedom. But minds like Guiteau's are capable of confusing the old commonplaces with the new theories. In practice he was a wild office-hunter, maddened by ambition and soured by failure. But in one of his papers he wrote, quite in the high style of the political evolutionist, "The President's tragic death was a bad necessity, but it will unite the Republican party, and save the Republic." And he goes on, in the manner of a celebrated consolation, "Life is a flimsy dream, and it matters little when one goes. . . . A human life is of small value." These are precisely the theories of what may be styled the Higher Assassins. The Nihilists have, probably, no personal ill-will against the people they blow to pieces. The Irish have no personal ill-will against the babies into whose nurseries they fire, or the children and old women beneath whom they explode tin cans full of gunpowder. They philosophically regard these lives as mere cyphers, to be cancelled in working out a political problem. Mr. Guiteau, though a hungry office-seeker and Chicago lawyer, had reached the same cold pinnacles of thought. To him the success of people likely to place him in office, and to keep up the merry game of jobbery, was like some great beneficent end of nature. Private individuals must suffer, as Nature works out her will; and the murder of a President was a mere neutral incident in the advance of the Stalwart party to control over "the offices." From a chance expression of the President's, as he lay half delirious, it seems that he thought Guiteau was influenced by a mere insane vanity. "I

suppose he thought it would be a glorious thing to emulate the pirate chief." Guiteau's character, by his own father's admission, is one naturally framed for "almost any stupidity, folly, or raceality." But even his father seems to doubt whether he can be called insane. "If called as a witness, I believe I should testify that he is absolutely insane, and hardly responsible for his actions." This is a very hesitating expression of opinion. Probably it is true that Guiteau has the levity, vanity, and selfishness of the born criminal. But it is equally probable that he would have avoided this particularly abominable offence if he had not lived in the air of political money-making and at a time when political assassinations are recommended by some and palliated by other public writers.

Possibly there may be one favourable result of this miserable affair. The Americans have been treating very lightly the threats and murderous conspiracies of some Irish boasters and blackguards who live among them. They have chosen to regard the raising of money for assuredly murderous purposes as a harmless eccentricity. They have tolerated speeches in which promiscuous murder on a large scale and indiscriminate slaughter by aid of infernal machines were advocated as patriotic duties. It has been their line to take all this as the mere effervescence of free speech, a harmless froth upon the surface of Republican life. They have now learned to their cost that murder is no child's play, and that a man is not necessarily harmless because he cherishes and upholds theories of assassination. They now know that a temper is prevalent which makes the life of every public man unsafe. A foolish creature has been saying that it is his mission to shoot Mr. Blaine. Missions of this sort are growing quite popular. As long as the missions were to be executed on this side of the Atlantic, as long as English houses and ships were to be blown up and English statesmen threatened, the matter seemed unimportant. America could not undertake our police work. But she has learned that to permit or encourage examples of this sort may not be without danger to herself. Morality is sometimes said to be a mere affair of geography. Disappointed office-seekers will fail to see why they may not do in Washington the things that Irish ruffians are permitted to prepare to do in England.

MR. BRADLAUGH'S LAST CHARGE.

IT may annoy everybody, but can surprise no one, that Mr. Bradlaugh should have taken the opportunity to renew his assaults upon the House of Commons in consequence of Mr. Gladstone's inclusion of the Oaths Bill in the company of more respectable innocents who are this year doomed to massacre at an earlier date than usual. For this inclusion the Government had, no doubt, the most excellent reasons; and it may very well be that, as often happens to persons who have not been formally admitted to the councils of their Sovereign, the reasons which weighed heaviest with them were not those which they avowed, either to others or to themselves. It was perfectly true, as Mr. Gladstone remarked, that the Oaths Bill answered eminently to the description of a measure which was not likely to pass without considerable opposition. But it is also true that the measure is one for which the Government, or at least their chief, had but little stomach. Mr. Gladstone was dragged and almost hustled into suggesting this Bill; he resorted to the most extraordinary expedients to render it unnecessary; and he must have raised the sacrificial knife with feelings as unlike those of Abraham or Agamemnon as can well be imagined. Mr. Bradlaugh, however, naturally does not take the same view of the matter. Newspapers which may be presumed to have some foundation for their assertions affirm, with what truth we cannot say, that the maintenance of his disabilities would have a very awkward effect, not merely on his general welfare, but on his political prospects. He has hitherto had no success whatever in the courts of law, and a final failure would leave him burdened with heavy penalties and costs. The result of a possible bankruptcy would make him, until he obtained his discharge, ineligible as a candidate at Northampton; and it is needless to say that Mr. Bradlaugh elected, but not able to take his seat, and Mr. Bradlaugh simply disqualified, and with another sitting and voting in his room, are two very different persons. At present the great argument of those who are compelled to forego the attempt to represent Mr. Bradlaugh as a martyr of religious intolerance is to bewail the injustice done to Northampton by allowing her to be represented only by Mr. Labouchere. In the case proposed Northampton would be fully represented, and the battle-horse of the Bradlaugh party would be withdrawn from between their legs.

If Mr. Bradlaugh is a vindictive person (and not a few of his utterances might warrant the supposition that his dislike to the dogmas of Christianity extends in this respect, at any rate, to its morality), he ought to hate the Government much more than the Opposition. Mr. Gladstone has, indeed, backed his friend on this occasion in a manner not calculated to excite lively gratitude even in the most susceptible bosom. It was distinctly owing to the influence of the Government that the House of Commons was betrayed into the undignified and illogical position of inviting Mr. Bradlaugh, at heavy risk to himself, to obtain for it from the courts of justice a direction as to its own rules of admission. This trap was not set or baited by Sir Stafford Northcote or by Lord Randolph Churchill, but by Mr. Bradlaugh's own party. Nor in any subsequent proceedings have the Government

espoused the cause of their supporter as might have been expected. They have behaved towards him rather as weak-minded members of a family sometimes behave towards a poor and disreputable relation than as the head of the house might be expected to behave to an acknowledged house-mate. They have left back doors open for him at night; they have allowed scraps from the larder to be arranged where he could lay hands on them; they have deposited cast-off clothing in a secluded barn, and otherwise shown that charity which is decidedly ashamed of itself and its object. And now they announce their intention of making no effort to continue even those small and questionable mercies. Mr. Bradlaugh may go to Northampton or anywhere else for them; other people object to him, and he is to be left to himself and his objectors accordingly. It is now said that they will not engage to resuscitate the Oaths Bill next session. The recently published correspondence between the Prime Minister and his faithful supporter is a most curious collection of documents. Mr. Bradlaugh is nothing if not a writer of letters, and his letter-book must, as a curiosity, exceed even that of Mr. Toots. He writes to the Speaker, he writes to Sir Stafford Northcote, he writes to members of Parliament who make what he considers to be injurious statements in reference to himself and his associates. In Mr. Gladstone he might justly think that he recognized a kindred spirit, for Mr. Gladstone also writes to everybody. But, just as it has been noticed that two celebrated diners-out, when in each other's company, flag and faint; just as the two fencing masters the other day in Paris performed but inefficiently in mortal combat; so these two great epistolists and speakers show but few of their gifts in this correspondence. Mr. Gladstone, though not so laconic as he sometimes is on post-cards, is very much shyer of engaging. He informs his correspondent, even at the very outset, that he would very much rather have nothing to do with him. Mr. Bradlaugh, he says, is aware "to how considerable an extent Liberal and public interests have been brought into prejudice by untrue suppositions as to communications between you and the Government." He would therefore much rather not grant the interview which Mr. Bradlaugh humbly desires. Who the wicked people may have been who untruly supposed that Mr. Gladstone or the Government had communications with a faithful supporter, whose interests they were evidently striving in an earnest, if peculiar, fashion to advance, we shall not pause to inquire. It is clear that Mr. Gladstone thinks them very bad men. They have brought Liberal and public interests into prejudice; a delightful marriage of terms, only perhaps to be paralleled in that celebrated ascription by Suwarrow of the capture of Ismail to God and Catherine II. which shocked Lord Byron. In short, Mr. Bradlaugh, if not a nuisance himself, has been the cause of a nuisance, and Mr. Gladstone would much rather have nothing to do with him. The attitude—Mr. Gladstone is fond of the word attitude—is not heroic, perhaps, but it is intensely natural. "Only think, my dear fellow, if I were to be seen in your company!" is the meaning of the remark, disengaged from private-secretary verbiage, and it is to be hoped that Mr. Bradlaugh liked it. It does not appear that the unfortunate person who has unintentionally been the cause of prejudice to Liberal and public interests resented the implied slight. Perhaps he knew that if he were to seem to lose respect for Mr. Gladstone even the Nonconformists of Northampton would fail him. He contented himself with trumping a favourite card of Mr. Gladstone's by pointing out that there were four courses open, and by announcing—we think he has said it before—that so long as he had life he would not permit physical force to prevent him, &c. Mr. Gladstone does not seem to have entered into argument on Mr. Bradlaugh's four-course system, probably taking the introduction of the fourth as personal; but he remarks that he has "much to consider," which, coming from a Prime Minister, is a proposition which we cannot imagine any person seriously disputing. Mr. Bradlaugh is referred to the Speech from the Throne—can it be possible that this is an adroit repudiation, on the part of the cunning Premier, of Republican sympathies?—and no subsequent attempts of his to "draw" Mr. Gladstone avail. He is informed that the Government cannot attempt the Oaths Bill, and a second reference to the Speech from the Throne is made, which would probably have drawn from any but a faithful Radical a spirited "counter" on the subject of the Transvaal. Then Mr. Bradlaugh ends, not in anger, but in sorrow. He "concludes from Mr. Gladstone's silence"—reference to speeches from thrones is, one would think, even worse than silence to Mr. Bradlaugh—that the Government "are unable or unwilling to enforce the law in the matter."

Yet, as we have said, it does not appear that Mr. Bradlaugh is at all angry with the Government. It is still the wicked Tories, the base holders of perpetual pensions, whom he blames, and one of the most eminent of those persons with whom he acts has informed the public that, in order not to embarrass the Government, he will not even make that raid on the House of Commons which was threatened until the Land Bill is safe. Meanwhile the House is prepared for him. It is even said that the Inspector on duty is to have notice of the coming struggle, so that everything may pass in the most chivalrous manner. Mr. Bradlaugh, apparently, aspires after imprisonment, an aspiration which it may be trusted will not have to be gratified. Yet, if it be so, he must surely ask himself as he sits in his dungeon who has brought him there, and it will surely be odd if he does not come to the conclusion that it is Mr. Gladstone and the Government. But

for their ill-advised and half-hearted assistance he might have been an interesting martyr; his name might have ranked with the great names of O'Connell and Salomons; he might have sat for the duration of the present Parliament silent, voteless, but protesting; he might have retained the respectful veneration of all the Liberal organs, and yet not forfeited the esteem of Northampton and the Hall of Science. This is now impossible. His political friends in discussing his case remark rudely that he has excluded himself from personal sympathy. The leaders of his party inform him in effect that they are very glad to have him to vote for them, and that such a relation is all very pleasant and friendly, but that as for hurting themselves and prejudicing Liberal interests for his sake, they do not see it at all. The fervent admiration of Mr. Labouchere, the devoted fidelity of Northampton, is still his, but though the first is of course unalterable, the latter may perhaps be considered liable to change. It is conceivable that even Northampton may come to think that it is better to have two members than one, and that if the two are to be had it might be well that they should be persons whom the Prime Minister of the day does not politely decline to see because the suspicion of communications with them brings prejudice to public and Liberal interests. The project of literally taking the House of Commons by storm is unlikely to succeed in face of the Speaker's orders and the attitude of the Prime Minister. And, when Mr. Bradlaugh had been for a few times committed to the Clock Tower or to Newgate, people would, in all probability, vote him a nuisance and a bore, which state when an Englishman reaches it may be said to be all up with him. Mr. Bradlaugh has come near to this perilous condition as it is, and his proposed course of action will assuredly complete the process. After all, perhaps Newgate would not be necessary. Who is it who tells the story of an obstinate beggar in an Eastern clime who, wearying out the patience of some great one by perpetually standing at his gate, was at last vanquished by being regularly built up into the wall—immured in masonry? The beggar, if we remember rightly, stuck to it till the bricks reached his chest, and then capitulated. With Mr. Bradlaugh, a man of great strength of character, it might be necessary to go on to the chin. Unluckily, we are a humane and foolish people; and there might be objections to such an addition to the structural and decorative features of the Palace of Westminster being thoroughly carried out in case of obstinacy. Yet the plan would have several merits. It would effectually get rid of Mr. Bradlaugh, and it would materially add to the interest of Sir Charles Barry's edifice in the eyes of Americans, country cousins, and such-like pilgrims, avid of striking historical associations with the places they visit.

PROFESSOR ROGERS ON THE HIGHER EDUCATION.

SOME weeks ago Mr. Thorold Rogers had a little controversy in the *Times* with the Tutors of Christ Church as to the present efficiency of the education at what Christ Church men pride themselves on designating "the House." Into the merits of that dispute we need not enter here, but it was rather amusing to find the Radical Professor—we believe he would exult in the name—meeting the elaborate catalogue offered for his confutation by the Senior Censor of honours recently gained from Christ Church by the highly Conservative rejoinder, that they were mostly obtained, not in the good old classical schools, but in scientific and other modern subjects to which he himself attached no great educational value. It is gratifying to know that the distinguished Liberal who said more information could be derived from a single sheet of the *Times* than from "all the works of Thucydides" is not likely to find his literary heresies endorsed by Professor Rogers; neither probably would he be disposed to accept Lord Sherbrooke's arithmetical calculation of the relative importance of the battle of Marathon and an explosion in a Welsh coal-mine. But the same odd combination of rigid Conservatism with ultra-Radicalism, of fact and fancy, sound common-sense and theories as wild as the statements urged in support of them are often wholly unjustifiable, which generally characterizes the public utterances of the learned Professor, is certainly not wanting in his latest contribution to the enlightenment of his countrymen. This is indeed the less to be wondered at as his article on "Parliament and the Higher Education" in the current number of *Fraser's Magazine* deals chiefly with the condition of Oxford, and we are only saying what Mr. Rogers would probably consider rather a compliment than otherwise to his reforming zeal, when we describe him as a kind of academical Ishmael, whose hand, if not exactly against every man, is against every College—as in the recent instance of Christ Church—and who seems to feel the hand of every College to be against him. To particular Colleges and particular Professorships—e.g. theological ones—he has a special antipathy, but Colleges and professors generally he loves, if wisely, not too well, nor would an intelligent reader of this latest article of his need much reading between the lines to find it out. The final suggestion, even if it stood alone, that a Minister of Education should be appointed, with supreme control over the Universities as well as the Civil Service Commission and the Endowed Schools, and still more the reasons given for regarding such a measure as the "one remedy" and only "reasonable hope" for raising Oxford and Cambridge above a level "far inferior to fourth-rate German Universities," would illustrate the writer's animus pretty plainly. But he begins with an historical

sketch of Oxford, from its origin till 1854, which is interesting and in the main accurate, and to this we may first direct the attention of our readers. It is introduced in the following passage, where, as will readily be observed, the sting is in the tail:—

Of the antiquity of Oxford, of which I particularly wish to speak, there is no doubt. It was certainly in existence in the twelfth century. The colleges in the universities, originally more excrescences on a large and varying body of independent students, were governed by statutes framed by their several founders, though from time to time the founder's rule was modified or interpreted by the visitor. The State did not interfere with the endowments of these colleges or the tenure of them, except that the Universities were visited by the Crown in the successive reigns of Edward VI., Mary, and Elizabeth, when those who did not conform to the Establishment were expelled. But the statutes remained unaltered, many of these regulations binding the fellows to the practices of the Unreformed Church. Oxford colleges were founded from the thirteenth to the eighteenth centuries. The ancient system of the University was represented by a few halls, which originally elected their own rulers, and still kept up the form of doing so. But Leicester, Chancellor of the University in Elizabeth's reign, contrived to get the nomination of these heads into his own hands, probably in order to strengthen the position of the Puritan party in the University. This usurpation soon hardened from a precedent into a right of patronage. It is fair to say, that the right was not on the whole abused till the days of the latest chancellors. Some of the most distinguished members of the University have been heads of halls. The right of being an independent member of the University, the most ancient form of membership, was extinguished by Laud, who procured a statute compelling every member of the University to become a member of some college or existing hall. James I. accorded to the two Universities the privilege of being represented in Parliament, a privilege which Elizabeth more wisely had refused.

The privileges of the Universities were originally accorded by royal charters and papal bulls, but they were incorporated by Act of Parliament in the reign of Queen Elizabeth. No attempt, however, was made to interfere with their internal government till the time of Archbishop Laud who, in his capacity of Chancellor, drew up certain statutes which were authorized by the King. It is no doubt literally true that "from the beginning Oxford was a secular institution"; the Bishop of Lincoln, in whose diocese it was situated, had no jurisdiction over it, and when Henry VIII. founded the See of Oxford, the new diocesan was similarly precluded from all interference. But it is rather absurd to talk of the Universities being "handed over to the Establishment at the Restoration," because the Act of Uniformity was extended to them. Does Mr. Rogers imagine that before the Reformation, any more than after it, any dissent from the authorized teaching of the Church would have been tolerated for a moment in the chairs or colleges of either University? As to the colleges, in nearly all of them the members on the foundation were ecclesiastics of some kind, while some were founded for directly religious objects, as e.g. All Souls for masses for those who fell at Agincourt, and Lincoln—as Mr. Rogers himself reminds us—for the suppression of Lollardism. And there is something quite grotesquely paradoxical in his statement that "up to the Act of Uniformity, in 1562, admission to orders was not, and had not been, even in pre-Reformation times, a condition precedent to holding deanery, canonry, dignity, or even rectory. The Act of Uniformity took capital offices from the laity and gave them to the clergy." The object of this provision in the Act of Uniformity, as is notorious, was to exclude ministers who had not received episcopal ordination, and were therefore from the Church point of view laymen, from holding benefices, many such having been intruded into livings and dignities during the Commonwealth period. But if canonries and livings, and, we may add, bishoprics and rich abbacies, were occasionally held by laymen "in pre-Reformation times," that merely means that by a gross abuse, in defiance both of canon and civil law, mediæval Popes were apt to thrust Italian nominees of their own—often mere boys—through favouritism or bribery, into posts for which they were not legally qualified except by dispensation. These interlopers were generally, however, in orders of some kind, when not actually priests. And this was just one of the most glaring abuses which led to such constant bickerings between England and the Court of Rome, and helped to pave the way for the Reformation. Mr. Rogers is more correct in saying that College endowments at Oxford were almost always limited to particular districts, families, or schools, though there were some notable exceptions. The Oriel fellowship, and the scholarships at Balliol and Corpus, owed their recognized pre-eminences to their being "open" instead of "close" foundations. The abolition of nearly all the local or other restrictions, and of the test of comparative poverty as a condition for holding a college endowment, was no doubt the most sweeping innovation effected by the University Act of 1854, and we quite agree with Professor Rogers that, whatever may be said in favour of the change on other grounds, it has had, as it was foreseen that it must have, one very undesirable result, in barring the road to humble merit, and pouring endowments intended for the poor into the lap of the rich. This is equally true of course—not to say still truer—of scholarships thrown open or newly founded at our public schools, for the test of competitive examination applied to boys of twelve or thirteen reveals more expensive "coaching" than native talent, and almost inevitably results in giving to him that hath what was originally intended for him that hath not. It is too true also that "incredible injury was and is done to the mind of youth," both in its earlier and later stages, "by speculative cram," and that often enough "the schoolmaster," much oftener the private "coach," "has crammed the boy with an incurable dyspepsia of the intelligence," so that "he has won his scholarship at the expense of his education." But we cannot at all follow the writer in his sweeping indictment against the English public schools of half a century

age, which, as he assures us, "with very rare exceptions, were in an utterly unsatisfactory condition, and gave next to no instruction whatever"; nor do we believe that then, any more than now, the best education was found in private schools. The curriculum in both alike may have been a narrow one, but what the public schools taught they generally taught well, better perhaps than they sometimes teach it now. The wholesale charge of favouritism and neglect against the whole class of College tutors, past and present, is no less characteristically unjust. Certainly "it is a common saying in Oxford"—in other words, it is a common joke—"that the clever men are to be found in the third class, the dull and industrious in the second, the examiners' friends being put into the first." The common form of the saying is, or was, that the clever men got seconds and the examiners' friends got into the first; but, as Dr. Newman—who is said to have been a poor Greek scholar at the time—got a third, the other version also gained currency. But when Mr. Rogers gravely adds that "the statement is undoubtedly an exaggeration," but that there is no public conscience in Oxford to prevent its becoming a reality, and that in fact it often is verified, we can only marvel at his curious incapacity for distinguishing an epigram from an argument.

The permission to marry which has been accorded during the last few years to some fellows of Colleges and to many tutors who are not fellows is no doubt a questionable advantage to the cause of collegiate education. It acts, not only as college livings used sometimes to act in the days of clerical restriction, in keeping up superannuated tutors, but has a further drawback of its own, which is noticed in the following passage:—

The college tutors have generally obtained permission to marry. It is almost superfluous to say that this concession quarters them permanently on the college, however unfit they may be found to be for the function of giving instruction. They also necessarily cease to fulfil the first duty of a tutor, that of looking after the undergraduates' conduct and progress. After two or three hours of routine work in the morning, the college married tutor is away at his villa. The discipline of the college is left to the very few resident fellows, and it is creditable to undergraduates in college that at the present time, with little supervision over them, riotous freaks are far rarer than they were a generation ago. But the undergraduate is a far more adult person at the present time than he used to be.

We may add that, in spite of the "adult" personality of modern undergraduates, "riotous freaks" have occurred in more than one Oxford college during the last few years which might be directly traced to the cause indicated above. But Mr. Rogers seems to object, not only to married tutors, but to College fellows and tutors altogether. When he roundly asserts that "there is not the slightest justification in endowing the vendor of a marketable commodity, such as a knowledge of the art of teaching Latin, Greek, or mathematics," he is—we will not say proving too much, for he may perhaps be prepared himself to accept the full consequences of his argument—but he is laying down a principle which goes far beyond any application he has here taken occasion to make of it. Nor is the general rule by any means so self-evident to everybody as he appears to think—even with the help of his personal illustrations—that "free teachers do very much better in the open market than College tutors do in the close, whether one considers their profits or their successes." And to say that it is a mere "waste" to endow "four teachers of Anglican theology at Oxford," when the demand for such teaching by candidates for ordination would anyhow create the supply, is to formulate an argument equally available—perhaps intended to be equally available—against ecclesiastical endowments altogether. It is of course just as wasteful an interference with the natural laws of supply and demand to endow preachers for Anglican pulpits as professors for chairs of Anglican theology. Meanwhile it is eminently characteristic of the Professor's Ishmaelite temperament that he clinches his argument by the flattering suggestion that no "Oxford professor of divinity," since those chairs were founded, has ever done anything for Anglican theology. Without going back very far or entering on any very recondite investigation, such names as Bishop Lloyd, Dr. Burton, Dr. Pusey, Dean Mansel, Professor Hussey, Dr. Shirley, Dr. Mozley, and Dr. Bright would at once occur to most Oxford men as affording a curious illustration of this discriminating verdict. There are several other *obiter dicta* of a not very complimentary kind scattered over the article which it would take too long to examine in detail here. It is not necessary to inquire more particularly whether "the mob of country clergymen (who enjoy the University franchise) are the most insane body to which a public duty could be entrusted"; or whether again, when a vacancy occurs in the Oxford professoriate, "there is a scramble, in which the least competent candidate ordinarily manages to fill the vacancy," while, if now and then "a really competent person is, by a happy accident, promoted to a professorship," he is pretty sure to have an incompetent successor; nor shall we stay to analyse the pleasing assertion that "the Law professors have generally been, and perhaps will continue to be, unsuccessful barristers with academical friends." But it is a graver matter when the writer not obscurely intimates that "academical morality" is wholly defunct at Oxford, and bases this startling indictment on a fact which would be irrelevant, if correctly stated, and about which he happens to be quite mistaken. It is simply not the case that "the feeling"—which means of course the general feeling—"in Cambridge, where academical morality is by no means extinct, is hostile to the existence of heads of colleges altogether." There is, no doubt, a Nihilistic section, so to call them, among the younger Liberals at Cambridge, as there also is at Oxford, who

would like to see the Heads of Houses improved off the face of the earth, though they have not yet propounded any theory as to who or what is to be substituted for the deposed authorities. But this is not the prevalent opinion at either university, and the Professor's novel discovery that "these people generally have nothing to do" and are simply "*fruges consumere nati*" will probably cause as much surprise at Cambridge as at Oxford. Neither is it indeed altogether clear that hostility to heads is a sure criterion of "academical morality." We will not undertake to identify the well-known head of an Oxford College who suggested "that his own large stipend should be further increased and that he should be allowed to be non-resident," but the context appears to point to a man distinguished alike in the academical and literary world, whose opinions may be in some respects peculiar, but who certainly cannot be accused of indolence or incompetence.

We have referred already to Professor Rogers's demand for a Minister of Education to dominate the two Universities. It is true enough that "there is little to be expected from the direct action of Parliament" in the matter of University reform, though we can hardly think it "unlucky" that so miscellaneous a body should scruple to legislate on details with which it is and must remain wholly unfamiliar. But the explanation here given of its unfitness is remarkable, especially as coming from such a quarter. "Class representation in Parliament," we are told, "is of no value—it is a positive mischief. Oxford and Cambridge have rarely sent their representatives to Parliament who have advocated anything but the meanest interests of the meanest rank of clergymen." There is therefore no hope from the direct intervention of Parliament, and still less of course from the independent action of the Universities themselves. What good thing can come out of a Nazareth where there is "not enough of public conscience to reprobate," or "prevent," the systematic perpetration of "the gravest scandals," whose constituency is "the most insane mob" ever accredited with a public trust, who, when by some rare accident "they have been represented by great capacity, have never rested till they have got rid of incongruous intelligence?" We have now probably said enough to indicate the general tone and temper of Professor Thorold Rogers's last contribution to the question of University reform; but the following extract, with which our notice of it must conclude, contains so amusingly characteristic an estimate of the *personnel* of the present Oxford Commission that it would be a pity to omit it; the final hit at "a country clergyman"—presumably an obscure unit in the "insane mob"—will be duly appreciated by those to whom the name of Mr. Osborne Gordon is familiar:—

The composition of the Oxford Commission was ludicrous in the extreme. At the head of it was put an ancient nobelman, who took his degree at New College, when the members of that society were exempt from all academical examinations, some sixty years ago, and had never had any relations with the University since. There was only one member of the Commission who had any intimate acquaintance with the University, and this member, though a person of singular abilities, was equally singular for his indecision. There were three lawyers on the Commission—Lord Selborne, Mr. Bernard, and Justice Grove—men of undoubted ability, but not informed as to the present state and present needs of the University; a country gentleman and member of Parliament, who had been a fellow of All Souls, and is understood to be the most practical and sensible person in the whole body; and a head of an Oxford college, of whom nothing need be said besides. Justice Grove resigned, and was succeeded by a country clergyman, who twenty years ago had been censor of Christ Church; and finally Lord Selborne resigned, to be succeeded by the Master of University, who would have been better appointed at the first constitution of the Commission.

UPSTAIRS IN WESTMINSTER ABBEY.

WE are so accustomed to the fact that little or nothing remains of most English abbeys except the church that we say "abbey" when we mean "church" in a great many cases. As a good deal remains of the convulgent buildings of Westminster Abbey, there is nothing extraordinary in going upstairs or downstairs or in the Abbot's chamber. But such ups and downs within the church itself strike the visitor as somewhat strange. He does not know, or has no means of knowing, that there are in some places at least two storeys above the ground floor, that above some of the chapels are hanging chantries, miniature churches in themselves, and long drawn aisles full of strange monuments. None of these nooks are shown to the public. It would be impossible to show them to more than a very few visitors at a time. The stairs are not only narrow and dark, but fragile in some cases, and when you reach at length the upper floor you often find it a very irregular surface on the top of the groining, without any railing to prevent you from falling into the nave or choir below. Nor is it altogether worth the trouble involved in ascending, for people do not always care to get behind the scenes and be made acquainted with the seamy side of what they only know as the perfection of beauty and order. The most lovely buildings in the world have their uncomely parts, and Westminster Abbey is no exception to the rule. The strange thing about visiting the triforium is the difficulty of recognizing the antiquity, the historical association, the absolute value of every heap of dusty rubbish which has accumulated there in the course of centuries. Here, a bundle of pieces of broken boarding are the canopy of some great king's tomb removed to make way for the burial of a greater. There, a heap of broken stones are fragments of the monuments and chantries destroyed as idolatrous

in fanatical times. A confused collection in a corner of carved and gilded scraps of plaster or wood represents the pomp of heraldic ornament at the funeral of a duke or a general. Nothing is lost that has once found its way into the church; and the storehouse has ample room for everything worth preserving, as well as for much that has ceased to interest the people of this generation.

The ascent is made by various flights of stairs. One of these opens on the east aisle of the cloister, close to the entrance of the Chapter-house. When the ancient church of the Confessor was superseded by the more magnificent building of Henry III., the cloisters, though they abutted on the new groundplan of the western aisle of the south transept, were not removed, and the Poet's Corner is thus defrauded of its full proportions. The cloister is much lower than the aisle would have been in its place; and over it is the muniment room, with its iron-bound coffers. The triforium is another flight above, and the winding stair is steep, slippery, and dark. When at length we stand on the red-brick pavement and look around, we are surprised to observe the great size of the chamber which intervenes between the top of the vaulting below and the timbers of the roof above. Nothing gives a better idea of the vastness of a building than to see the greatness of its minor parts. The pavement, which only dates from the time of Wren, becomes more irregular as we turn into the triforium of the nave. It conceals the "pockets" of the vaulting, receptacles probably filled with fragments of the statues and altars displaced at the Reformation. At the further end, in the south tower over the Abbot's Chapel or baptistery, the floor was of wood. On its being removed, the remains of Torregiano's images in terra-cotta, for the decoration of the altar in Henry VII.'s Chapel, were found. They indicate rather than prove the magnificence of the whole structure; but are broken into such minute pieces that the united efforts of several antiquaries have so far failed to make up a single complete figure. Among them is the "torso" of a splendidly modelled statue of the dead Saviour, and beautiful are the feet of the angels of the canopy. This altar, which was engraved by Sandford as the monument of Edward VI., was destroyed in 1643 by one Sir Robert Harlow, who deserves to go down to posterity with Erostratus and Lloyd. Some portions, identified at Oxford among the Arundel marbles by Mr. Middleton, have been recently restored to their place, but it is to be feared that the terra-cotta fragments in the triforium are beyond repair. The chamber over the vaulting of the Abbot's Chapel, in which they were found, was that occupied, it is said, by Bradshaw, President of the High Court of Justice which condemned Charles I. The Deanery, with which by a separate staircase this part of the triforium communicates, was granted to Bradshaw, who died in it in 1659. Constant tradition avers that he actually died in this very room, a room which certainly was at some period used as a lodging, for it contains a fireplace of Late Perpendicular work. Hence, along the triforium his restless spirit walks on the nights of the 30th January and the 22nd November; and in truth a more ghastly-looking corner than this it would be difficult to imagine. Little cherubs peep out here and there from behind the marble pan-cakes removed from the monument below of Admiral Tyrrell. Close by are two wooden obelisks removed in 1775 from the entrance to the choir, where, according to Dart's view, they stood on the summit of a pair of tall classical gateposts. A label on one of them attributes the carving to Gibbons, but this ascription is more than doubtful.

In those parts of the triforium which are over the apsidal chapels some curious collections have been formed. A buttress of Henry VII.'s Chapel long concealed a window here, and in it have been found some panels of the original glazing of the thirteenth century, being among the most ancient and complete examples of the kind left. They are very different from most of the modern glass. The delicacy of the design, the moderation in the use of colour, and the evident desire to admit as much light as possible, are all qualities which our glass painters, with a few exceptions, do not care to seek after. In another recess is a ghastly cast in white plaster of the لندن coffin of Henry, Prince of Wales, the eldest son of James I. In a third are the remains of the old pulpit which used to stand in the nave, with its sounding-board and some exquisite carving. Further on are the very similar panels of carving which adorned the organ pipes, and some portions of marble statues and tablets. One of these last seems never to have been put up. Perhaps the fees were refused. On the beams above are placed in two long rows the helmets used at various times in the heraldic decoration of funerals. There are probably as many as seventy of them, but not one of any great value or beauty. Among other relics are two marble slabs long packed up in a box. They are beautifully carved in the late Italian style which Horace Walpole admired so much, and are clearly of his time or a very little earlier. On one is the head of St. Mary the Virgin, and on the other that of the Saviour. There are many points about them unsuitable for the decoration of a Protestant church, and so tradition or some wiseacre assigns them to a destroyed or unfinished monument of Anne of Cleves. But a glance at what does remain of her tomb in the choir below is sufficient to set that part of the question at rest. Near the marbles is a relic both of more interest and of less doubtful antecedents. Bundled up in two or three faggots are the venerable railings of the tomb of Edward I. How it comes to pass that in this "restoring" age they are not set up again in their proper place it would be hard to say. But architects are fond of a kind

of restoration which consists of the evolution from their own inner consciousness of a conception of what a thing ought to have been, and are apt to neglect such a piece of evidence as this as to what it was. With regard to these railings, however, there is not any manner of doubt whatsoever, for they are figured by Dart in their proper place. Dean Stanley tells us that in 1764 the mob broke in during the funeral of Pulteney, Earl of Bath, and that the gentlemen who attended his body to the tomb in the Islip Chapel, opposite, tore down the canopy of Edward's tomb, and defended themselves with "the broken rafters." It may be so; but these iron spears, each tipped with its fleur-de-lis, would form much more obviously appropriate weapons on such an occasion. The "wooden hatch put up by Feckenham at the head of the stairs" has been restored, but not the beautiful rails. From the northern side of the triforium a fine view is obtained into the Poet's Corner and the muniment room, with its great chests and coffers, erroneously described by Scott as being in the triforium itself. But in the upper story is a quadrant-shaped cope-chest and other vast chests for vestments, interesting in themselves, but not so splendidly locked and barred and clasped as the boxes in the muniment room below.

Another interesting place upstairs is the chantry or Chapel of Henry V. It is a kind of gallery over the headless effigy so familiar at the end of the Confessor's Chapel. We are accustomed to admire the swans and antelopes and the curious scenes from the King's life which are carved on the high screen under which we pass on the way into the Chapel of Henry VII., without remembering that it conceals one of the most elaborate little buildings of that age now remaining. It is raised so high that people far down in the nave must have been able to see the daily elevation of the host, and with a certain felicity, leading as it does to the Lady Chapel, was dedicated to the Annunciation. Some ingenious person has discovered that the western side of the screen, with its tall staircase towers, forms the letter H, the initial of Henry's name, and unfortunately some still more ingenious person has discovered that the helmet on the crossbeam is not that in which the King fought at Agincourt, but one specially ordered by the undertakers for the funeral. It is more solid, but scarcely more important, in truth, than the threescore and ten we saw in the triforium. When we climb into a neighbouring chantry, that of Abbot Islip, we find it filled with still more singular funeral monuments. The waxworks are no longer shown to the public, yet they are worth seeing, and are probably the most vivid likenesses remaining of the few personages they represent. Dean Stanley strangely observes that "they were even highly esteemed as works of art." No doubt they were. It is unquestionable that the figure of Chatham, with his keen eyes, his bushy eyebrows—features both lost in ordinary sculpture—his great nose, his commanding attitude, is brought more distinctly before the mind by a sight of this wonderfully-speaking effigy. Did Macaulay ever see little William of Orange standing on a cushion beside his tall stout wife, and observe the intensely real look of the slight figure, and the worn yet vivacious face? Certainly these figures were the work of no mean master, and if the Duchess of Richmond and her dead son, lying in state, are not so good, it is rather because the subjects were not equal to the art than because the art failed to do them justice. Even the comparatively faded figure of Charles II., which faces the spectator as he enters the chantry, is startling with its appearance of reality.

FRENCH IN THE ARMY.

TO what extent it is necessary that officers in the army should possess a colloquial knowledge of French is a point upon which the military authorities may be admitted to be the best judges. The Duke of Cambridge and Mr. Childers would hardly have made up their minds that it is necessary unless they had seen strong reason for doing so. If much study is a weariness of the flesh to those who are preparing for examinations, the examinations which demand it are scarcely less so to the authorities who are responsible for seeing the army properly officered. Every fresh subject introduced brings with it some fresh annoyance in the shape of the additional rock that it places in the way of candidates who, if this requirement could have been dispensed with, might have made very good soldiers. It is not unlikely that some readers of the letters which have passed between Lord Morley and the Chairman of the Committee of the Head-masters' Conference may be of opinion that the new demand which it is proposed to make upon candidates is simply part of that perverse system of competition which is making it more and more difficult for stupid young men to earn an honest living. They will be tempted to ask, with their grandfathers, where is the use of all this parleyvoicing? Those who can take a less immediately interested view of the question will not suspect either the Commander-in-Chief or the Secretary of State of any pedantic straining after an ideal perfection in military education. The War Office, they will feel sure, has had good reason to believe that an English officer is, or may be, decidedly more useful to the country when he can speak French than when he cannot, and in this conviction they will rest content.

When we pass to the method by which the War Office proposes to get what it wants, it is not possible to speak thus confidently. Lord Morley informs Mr. Bell that, at a date hereafter to be fixed, a knowledge of French, both scholastic and colloquial, will be

made obligatory on all candidates for admission to the various branches of the army, and requests him to bring the matter before the Conference of Head-masters, and to favour the Commander-in-Chief and the Secretary of State with any suggestions which he may think fit to offer in reply. It will be observed that the announcement that a knowledge of French, both scholastic and colloquial, is hereafter to be required from all candidates for admission to the army is made in somewhat too peremptory a tone to tempt Head-masters to say more on the subject than they could help. The suggestions asked for are evidently meant to be suggestions how the change can best be carried out in practice. Their opinions upon the merit of the change are not invited. What the War Office chiefly cares to know is how, and still more how soon, it may be introduced. The Head-masters have not allowed themselves to be deterred by this unusual decisiveness from stating their objections to the proposal itself. There are only a very few of them who either profess to be satisfied with the arrangements at present existing in their schools for giving a reasonable knowledge of colloquial French, or to see their way to making such alterations in those arrangements as would enable them to meet the wishes of the War Office hereafter any better than they do now. The majority, not merely in numbers, but in weight of experience, say frankly that what the War Office wants cannot be gained at a public school, and consequently that candidates ought not to be asked to produce it until they have had time to gain it after leaving school. They suggest that, instead of a knowledge of colloquial French being demanded from candidates for admission to Woolwich or Sandhurst, the examination in it should be postponed until the time that the candidate is about to receive his commission, a plan which would allow a residence of some months in France to be included in the course of preparation. The reasons given by the Head-masters for preferring their own scheme to that proposed by the War Office seem to us to be convincing. The postponement of the examination in colloquial French will allow of greater proficiency being gained in it, and will not entail on the candidate the loss of more valuable knowledge. In both these respects the plan proposed by the War Office is open to serious objection.

"In a public school the conditions of life and of class teaching are such as to make a training in colloquial French practically impossible." This, Mr. Bell says, is the conviction of the most experienced Head-masters. But for an article in the *Times* of Monday we should have thought, indeed, that their testimony was hardly needed to establish it. The *Times*, however, is clearly not of this opinion. It attributes the fact that "oftener than not the schoolboy of seventeen cannot string together an ordinary French sentence, while his younger sister can pilot the family through the Continent," to a bad tradition. A truer account of the matter is that the difference is accounted for by the difference in the trainings the brother and sister have severally undergone. However little a girl has been taught, she has usually been taught French; and the method in which she has learned it, though often very ill suited to give her any real knowledge of scholastic French, has been fairly well suited to teach her colloquial French. Whether at school or at home, she has had a French governess, to whom, if she speaks at all, she must speak in French; and she has probably been forbidden to use any other language in school-room conversation. If schoolboys were subjected to the same system they might equally profit by it, and the writer in the *Times* could not be better employed than in framing a model set of rules for making French the sole medium of conversation in the cricket-field or on the river, and the language through which the other subjects taught in the school shall be conveyed to the boys. As regards the first object, however, it is possible that boys might be less easily made to talk French while at play than girls have been during the sober recreation of walking or needlework. As regards the second, we own to some doubt whether in the improvement that girls' education is now undergoing this ability to speak French more fluently than correctly will not tend to disappear. As often as not, it was the one scanty harvest reaped from ground which in other respects was pretty much allowed to lie fallow. Now that other crops have to be raised on it it remains to be seen whether they will not crowd out the one which has till lately held almost undisputed possession. Whether this be so or not, the opinion of the Head-masters, as collected by Mr. Bell, is that the effort to give boys at public schools the necessary expertness in colloquial French would certainly entail the sacrifice of time urgently needed for "subjects of much greater educational value," and that the end attained by this sacrifice would be attained much more easily and surely without it. The utmost, they say, "that schools could do as far as a colloquial knowledge of a foreign language is concerned would be to attain imperfectly by the labour of years what can be effected in a very short time in the country itself." What schools can give is "a sound training in French grammar, vocabulary, dictation, and composition." They can prepare a young man for learning to talk French, but they cannot teach him to talk French. But this preparation will have two advantages of its own. In the first place it will make such colloquial facility as a young man may afterwards acquire a solid and permanent possession. He will know the language instead of merely knowing how to say certain things in the language. In the next place, it will have a genuine educational value. "Scholastic" French can be made to render the learner very much the same service that his

companions are getting from "scholastic" Latin or Greek, whereas colloquial French yields him nothing in the process of getting familiar with it, useful as it undoubtedly is hereafter.

There is a further objection to the plan proposed by the War Office in the fact that parents would very soon find out whether their sons were learning to talk French, and if, as the Head-masters predict, it turned out that their progress at school was exceedingly slow, they would not be long in removing them. "The attempt to make colloquial French obligatory on entrance to the army would cause candidates to leave the public schools a considerable time before the period of the examination to seek special tuition in England, or more probably on the Continent." This is the expression of "a strong consensus of opinion," but the truth of it is so obvious that no such consensus is really necessary to establish it. A year or two before the ordinary time of leaving school a boy would go abroad with his parents, and be put through his paces at tables-d'hôte, at booking-offices and on board steamers, in passages of arms about luggage and in remonstrances against overcharges in the bills. When he broke down under the ordeal, the father and mother would agree that it was useless to keep him at school to learn French when—"as the *Times* says, my dear"—his younger sister, whose education has really cost next to nothing, can talk it very much better. Common sense would point to sending him abroad for a few months for this special purpose, and this special purpose would in all probability be attained. But it would not be attained without a far more than corresponding sacrifice. He "would lose precisely the most valuable period of public school life, when a boy rising to the top of the school receives the most able and experienced teaching, and is also being trained to bear public duties and responsibilities." On the other hand, if the examination in colloquial French is postponed till after the candidate is ready to receive his commission, this residence abroad can readily be inserted into, or immediately follow, his Woolwich or Sandhurst course. During this interval he will be likely, under any circumstances, to spend some time with a crammer; and, as no class of salesmen adapt themselves with more readiness to the public wants, the moment there is a demand for crammers living abroad the difficulty will be to find a crammer left in England. They will migrate in flocks during the interval of notice which the War Office will give, and at the end of it be found building swimming-baths at Boulogne or boat-houses for outriggers at Tours. It is to be hoped that the War Office will be convinced by the reasoning of the Head-masters, and not adopt, either hastily or at leisure, a change of system which, as the military authorities themselves seem to suspect, will "have the effect of excluding from the army that most valuable class of English gentlemen—the young men who have passed through the public schools of the country."

ELECTRIC LIGHTING.

WITHIN the last few years electric lighting has made great advances. The improvements which have turned a brilliant laboratory experiment into a thing of everyday use and commercial value have been of two kinds—improvements in the lamps which produce the light by converting energy, in the form of electricity of current, into radiant energy in the form of light, and improvements in the means of obtaining electric currents from other forms of energy. At the present time we have for the production of the intensely brilliant lights which are coming into more and more general use for out-of-door illumination many excellent lamps, and five or six well-known forms of "dynamo" electric machines, which convert energy of motion (generally supplied by a steam-engine) into electricity. We are now speaking of the form of electric light most generally known—the arc light—in which two pencils of hard carbon are put in the electric circuit, allowed to touch, and then drawn slightly apart, when between them appears a band of intensely heated matter, which gives the most brilliant light known. When the advantages of electric lighting on this large scale became generally known, the question of lighting such spaces as are to be found in ordinary dwelling-houses by the new method naturally became one of public interest. There are several points which must be here considered: the arc lights on a large scale are cheap, the quality of the light is good; there is no consumption (under proper conditions) of the oxygen of the air or giving out of noxious gases. Against these advantages for domestic purposes we must set the facts that it is practically impossible to get an arc light of sufficiently small power for ordinary rooms, that small arc lights are expensive, and that the quality of the light is too dazzling from its very whiteness. However, electricians had another string to their bow in the principle of lighting by incandescence. If an electric current is passing through a conductor it heats it more or less, more heat being produced if the conductor is bad or offers a high resistance to the current than if it be good and offer but a low resistance; and by suitably adjusting current and resistance the conductor may be made so hot as to become a source of light. Some time ago, in noticing Mr. Edison's alleged inventions, we gave a brief sketch of the history of this form of light; we may go over the old ground again so far as to say that the first germ of the modern forms of incandescent lights was probably due to Mr. Swan of Newcastle, who employed as his source of light a thin thread of carbon, which the current raised to a white heat, and which he enclosed in a glass

globe exhausted in order to prevent the oxygen of the air attacking the carbon fibre, or, in other words, to prevent the carbon from burning. At the time when these experiments were first made less was known than at the present day of the various modes of preparing hard carbon suitable for such lamps. The appliances for exhausting the globes were not so perfect, and the means of preventing the leaking of air not so well understood.

After Mr. Edison had repeated all or most of Mr. Swan's former experiments under the firm impression that he was making perfectly new inventions, Mr. Swan again attacked the subject. Between the times of his first and second sets of experiments the attention of physicists had been much turned to the phenomena of electric discharges and of the action of radiant energy in very high vacua, so that they, their assistants, and the philosophical instrument-makers had been working hard at solving the problem of how to obtain and maintain a very high vacuum in a glass vessel, through the walls of which metal wires were passed, the result being that many of the difficulties in the way of the details of the construction of the lamp were removed. The growing demand for carbons for the arc lights, the use of carbon for telephone transmitters, of the form both of Professor Hughes's microphone and Mr. Edison's carbon transmitter, had led to much study and investigation of different methods of preparing carbon and of different materials from which to obtain it.

With improved appliances and with increased information, it was not long before Mr. Swan was able to bring a working lamp before the public which the improved dynamo machines could work at not too extravagant a cost. Indeed, Mr. Swan has already obtained more light from a given number of cubic feet of gas by using a gas engine to drive the dynamo machine supplying his lamps than could be obtained from the same quantity of gas burnt in ordinary gas-burners, in spite of the fact that incandescent electric lights must of necessity be more expensive than those of the arc form. Notwithstanding this economy, the light must be far more expensive than gas, for to the cost of obtaining power must be added interest on the first cost of machinery, and an annual charge for its wear and tear, together with interest on the outlay for wires, &c., and a further cost for renewing the lamps from time to time. However, if the light be used, great advantages are obtained. There is absolutely no burning up of the air, and no escape of poisonous gas, as there is in the case of every other known form of house light (with the exception of the globe gas light, which is expensive to fit, and about which the insurance offices, we believe, raise great difficulties). There is also very little heat. The light is beautiful in quality, being very like that given by Sugg's Argand burners, and, above all, it is perfectly steady. Again, when once the fittings are in place and the electric current supplied, there is no necessity for skilled attendance. The glass globes only require dusting now and then in the ordinary course of household work, and should a lamp become defective it can be replaced by a fresh one as easily and by the same means as a half-burnt candle can be changed for a whole one.

We have dwelt at this length on Mr. Swan's lamp before passing on to consider others, not only because to him belongs the credit—as far as it is possible to give credit to any one man for an invention in these days of rapid discovery and quick application of discoveries—of the first practical application of the incandescence of refractory conductors of high resistance to the production of a light, but also because his light has now stood the test of many months' practical use under the close observation of some of our most eminent men of science, and because all incandescent lamps have the same advantages and disadvantages as Mr. Swan's, the only difference between one system and another being in first cost and durability of the lamp. Another plan which has had some practical trial in England is that of Mr. Lane Fox. He has endeavoured to make the lamp cheaper than Mr. Swan's by using carbon and copper wire to make the connexions with the glowing carbon filament, instead of using platinum wire for the whole length, and has succeeded to some extent, though we venture to think that in practice it will be found that the increased expenditure for labour, owing to the somewhat complicated design of the lamp, will swallow up more than the saving in materials. Mr. Fox has also introduced other improvements in the processes of manufacture. Yet another system, the Maxim light, which we believe has satisfactorily stood the test of practical work in America, has recently been exhibited in London. The carbon fibre used is made from cardboard, a material which failed in the hands of Mr. Swan and Mr. Edison, but it is now used under new conditions; the globe is not only exhausted of air, but is filled with the vapour of some hydrocarbon and re-exhausted, this operation being performed several times, and at the last exhaustion a small quantity of the vapour is allowed to remain. The inventors say that this vapour deposits fresh carbon on the filament in any place which, by being too thin, becomes unduly heated, and that thus a system of automatic repair is kept up in the lamp for a time; for they do not claim an indefinite life for their lamp, though they say it will last eight or nine hundred hours. In addition to this, the method of fixing the carbon filament to the conducting wires is simple and inexpensive; and it is also asserted that, by means of a new composition, copper wire instead of platinum may be used, and sealed even more perfectly to the glass. They also exhibit a very ingenious and effective current regulator, which enables them with, say 130 lamps in circuit, to use any number of them, from one up to the full complement, and insure an equal brilliancy from each.

Let us now consider how the electricity is to be given to us. As yet there is only one economical method of obtaining such

currents of electricity as are wanted for lighting purposes—that is, by a dynamo machine turned by "power" of some kind. In many places it is possible to obtain water power, and hence very great economy; but in towns we must generally use the steam-engine or the gas-engine. There are two ways of supplying the current thus obtained—one is from some central station of great power, by means of insulated conductors branching off to the houses of consumers; and the other is for each consumer to make his own electricity on the premises. Now in the case of London the difficulties in the way of laying the conductors are very great. Their first cost is large, and, in the present state of electric engineering, the difficulty of keeping them properly insulated is enormous. Hence a large cost for maintenance is inevitable. We think, therefore, that the second plan is, at all events at present, the more practicable; and, were the Gas Companies to take the matter up warmly, the introduction of these lights would increase their revenues instead of diminishing them. Their expense will prevent their being used in small houses; but they might be used with advantage in houses with large reception rooms, which are now usually lighted with oil or wax candles, hardly ever by gas. Were these rooms lighted by electricity, the gas-engine would certainly be used, as it requires no attendance except cleaning and oiling, and may be put up in any house without increasing the rate of insurance. If the Gas Companies, then, fostered the introduction of these lights in such houses, they would open up a new market for their gas, and might also, by obtaining a very small increase of their powers from Parliament, develop a new branch of business by becoming agents for the lights and engines, and might even erect the whole plant and charge a rent on it, instead of compelling the consumer to buy it out and out.

CHARLEMAGNE IN THE "ARABIAN NIGHTS."

THE terrible old man who has suddenly become famous, James Carlyle, used to stigmatize the *Arabian Nights* as "downright lies," and sternly forbade the introduction of any such unwholesome literature into his house. This one, at least, of his various decided opinions has more reason in it than even the "most intelligent man" his son ever met could imagine. No book has put forward so many false pretensions and had them so completely exposed. The history of the intellectual vicissitudes of him who once believed in the *Arabian Nights* is the history of illusions dissipated. There was a time when we believed them all to be true; then for a longer spell we thought them at least original and Arabian; and now we know that they are neither the one nor the other, but a bundle of stolen goods, picked up in Persia, India, Europe, and we know not where, and merely "died garments from Bozra," dyed with Arabian colours, and patched here and there with the fibre of the date palm. The *Arabian Nights* are a palimpsest of the folklore of the world, written over with Kufic characters. Like their own wonderful stories which are to serve as an example to him who would be admonished, they are written in letters of gold on a ground of ultramarine; but only the forms of the letters are Semitic—the gold and the ultramarine come from *ultra mare vastum*, over the Indian Ocean, from the household tales of the Aryan race.

Even the things that might be trusted to be accurate are proved untrustworthy. It is only a month since "the good Haroun Alraschid," whom the *Arabian Nights* present in a highly favourable light, was shown up as a villain in the brief limits of a magazine article; and other pet illusions are in course of dissipation in the same quarter. When a character of the Thousand and One is not destroyed it is traced to a foreign source, with more or less success, till scarcely a fragment remains of the originality or truthfulness which once belonged to our childhood's companion. But, when we have once made up our minds to the change, and admitted that our old friends are not all we thought them, it is not hard to become reconciled to the new position. The *Arabian Nights* do not lose, but gain, when they are shown to belong to the same stock of household lore which has delighted the childhood and the age of all the nations of Europe and Asia. Each new discovery which throws light on the sources of this wonderful collection of stories has its value and interest, and the time for genuine regret will only be when there are no more relations to be made out.

The last instalment of *Arabian Nights'* genealogy comes from Dr. Bacher, who investigates one of the less familiar stories of the Thousand and One in the Journal of the German Oriental Society. Almost at the end of the eighth hundred of these Nights occurs a tale which Lane did not think worthy of insertion in his classical translation, on the ground that it was very similar to two other tales, both of which were included in his translation, but neither of which were among the best examples. Dr. Bacher, however, finds a special interest in this omitted story, and his reasons are worth considering. The story is entitled "Nouredin and Mary the Girdle-girl," and runs somewhat thus:—Mary was the daughter of the King of the Franks, who brought her up with the greatest care. She was the most "advanced" young lady of the day, and was not only remarkable for her learning and the elegance of her calligraphy, but was perfectly accomplished in all knightly exercises, and was as renowned for the use of the spear as for that more feminine instrument which served to gain her the epithet of "Girdle-girl," from the charming taste she displayed

in making waistbands. Kings sought her hand in vain, for her father loved her so well that he could not bear to be away from her one instant. Once, when she was very ill, she made a vow, if she recovered, to go on pilgrimage to a certain convent on an island. She was on the way to fulfil her vow, when her boat was seized by Mohammedan pirates, and she herself was sold as a slave in Kairowan. Here she nursed her master so devotedly that he promised never to sell her to any one she did not like. In accordance with this promise she was sold in Alexandria to a delightful young man, Nouredin, with whom she remained in the utmost happiness for a while, till the wicked old one-eyed Visier of the Frank king, came and carried her back to her home. Nouredin, as an Oriental lover, of course followed her to Europe, was taken prisoner, but, being assigned as servant to some church, met Mary, who came thither frequently for pious consolation. They resolved to fly together, but were stopped by her brother and turned back. Mary, however, slew her brother in single combat, and after him put two other brothers to the sword, and the lovers once more fly Eastward. Then the Frank king wrote a letter to the Khalif, the Prince of the Faithful, Haroun Alraschid, to beg him to seek out Mary and send her back to her father, and offering in return half Germany to build mosques in for Moslem colonists. The Khalif caught the refugees at Damascus, and had them brought before him at Baghdad. There he hears their story, and tells them the request of the King of the Franks; whereupon Mary speaks thus:—

"O Vicegerent of God on His earth, Upholder of the doctrine of His prophet, God keep calamity far from thee and guard thee from ill! Thou art God's vicar on earth, and thy creed is the true and enduring religion, the religion of Abraham and his seed, not what blasphemers believe in worshipping the Messiah. I am become a believer and acknowledger of the Unity, I worship God the Blessed; I know him and praise him, the One. So speak I before the Khalif; I bear witness that there is no god but God, and that Mohammed is the Apostle of God, God's servant and messenger, whom He hath sent with the guiding and the religion of truth, to make it triumph over all other creeds in spite of the gainsaying of the idolaters. . . . Is it in thy power, O Prince of the Faithful, to obey the blasphemer's letter and send me back to the land of the unbelievers, where they worship other gods and elevate crosses and adore idols? If thou actest, O Prince of the Faithful, I would hold to thy robe on the day of God's great muster, and complain against thee to thy uncle's son, God's prophet, Mohammed, the son of Abdallah, on that day when neither wealth nor children may avail, but only an obedient heart."

Haroun could not withstand her entreaty, and, after marrying the lovers, put the King of the Franks' ambassadors to death, Mary herself kindly officiating as headswoman. Nouredin has his relatives brought to Baghdad, and all live happily together until the arrival of the terminator of delights and the separator of companions.

Mary's conversion to Islam is, of course, the point of the story, and the moral—the counterpart of Wieland's *Oberon*—is not an uncommon one. The very next tale in the *Arabian Nights* has the same moral, and both remind one of the touching story of the Christian maiden, whom her lover, a Mohammedan sheikh, finds stretched senseless on the ground in her search for him, as Ferid-eddin has told it:—

There lay she as a corpse: her beauteous head
Bare 'neath the cruel sun; her little feet,
That oft had borne her through the mazy dance,
Bare on the sand; her eyes in deathly trance,
Her wavy locks profaned with dust; her sweet
Lips pale and dumb, that late were kissed so red.
Slowly the dreamy eye regains its sight,
The wildly beating heart flies to its love,
And shelters under tears that fall apace
Upon the sweetly-sadly smiling face
And feeble lips that strive awhile to move
And tell their burden in death's gathering night:—
"Love's ardent longing burns away my soul!
Let me not glow beyond a severing wall!
O may it be, that in a life renewed
Within Islam I may attain the good!"
Slowly she spoke the mightiest creed of all
That help men onwards to the eternal goal.
"My strength is gone, O why may I not live?
The parting comes—my fading senses reel—
From this earth dwelling, still so fair, I fly:—
Farewell, my sheikh, my master—love—good-bye!
No time—no words—to tell thee all I feel—
Faintness o'ercomes me—O forgive, forgive!"
And as she spoke, her soul to heaven fled,
A victim rich that love himself did slay.
As stormy clouds quench the sun's setting red
So in death's shadows passed sweet life away.

But the curious part of the story of Nouredin and Mary is its European character. Mary is called the "Girdle-girl," *zonn-dria*; and it is worth noting that the *zonn-dria* is a girdle only worn by Christians and other "infidels," and is in fact nothing but the Greek *zōnion*. Her brother is called Bertât, which is a very fair attempt at Berthold. Convents and pilgrimages are referred to, and church bells ring when Mary and her lover meet. These things seem certainly to point to a European source, and Dr. Bacher believes that he finds the original in the story of Charlemagne's daughter Emma and his secretary Eginhard, as related in Grimm's *Deutsche Sagen*. The parallel is supported by several points of detail, as well as by the similarity of the outline. The relations of the pair in the Oriental version are very remarkable. It is the princess who carries off her lover and defeats and slays the pursuers. Nouredin apparently acts as umpire on the occasion; and when Mary asks him how he feels before battle,

he admits, in what in these days would be held rather coarse language, that he feels horribly frightened. Something of the same character is given to Eginhard, the lover of Charlemagne's daughter Emma; in this legend, also, it is the lady who takes the lead, and conceals her lover under her cloak as they fly to the retreat where Eginhard is to lie hidden. The correspondence of the two stories is strengthened by the circumstances that Nouredin, when a prisoner, is made a church servant, whilst Eginhard, as Erzcappelhan, belonged to the ghostly profession. Charlemagne's love for his daughter was well known, and the father of Mary is also celebrated for his paternal affection. Charlemagne, moreover, was actually the contemporary of Haroun Alraschid, just as the *Arabian Nights* make the father of Mary; and there is a story of an embassy sent by him to Baghdad, which Dr. Bacher accepts on (we think) insufficient evidence, though he does not pretend that the great Karl had in contemplation any scheme for colonizing Germany with Moslems. The resemblance between the two stories is undoubtedly very striking, and there is no fundamental unlikeliness in the theory of an Eastward migration of an individual legend. The *Arabian Nights* were not collected till long after the early Crusades, and the Christian invaders might well have carried the story of Emma and Eginhard into the camp of Saladin. The kings of the East came to Cologne, and Charlemagne was only returning the compliment in repaying their visit.

YACHT RACING.

THE yacht racing season opened inauspiciously this year with a dispute, which even now is not settled. It seems that the owners of the principal racing yachts were so worried last year by having to sail under constantly varying regulations and by the absurd conditions which were laid down by some Committees that they determined not to race this season at any regatta at which the rules of the Yacht Racing Association were not accepted. In May it was announced in the *Field* that the Thames matches would be very dull ones, as the owners of the *Latona*, *Florinda*, *Miranda*, *Samana*, and other vessels had agreed not to enter for any races round the coast not held under Y. R. A. rules. As need hardly be said, neither the R. T. Y. C. nor the N. T. Y. C. recognize these rules. With regard to one of the vessels named, the *Samana*, there must have been some mistake, as she sailed in the races of what have been called the "Boycotted" clubs; and it is impossible to suppose that her owner, Mr. John Jameson, junior, would have broken a pledge he had given to his brother yachtsmen. With regard to the other vessels, however, the announcement proved to be quite correct, as none of them were entered for the early matches. This strike on the part of yacht-owners was seemingly viewed with great concern by the Committee of the Royal Thames Yacht Club, who entered into negotiations with the yacht-owners, and who appear, in dealing with a rather difficult matter, to have shown good sense and good temper, and to have been animated by a sincere desire to make all fair concessions to legitimate complaint. In one respect the discontented yacht-owners had made a mistake. No statement of their very just complaints reached the Committee until after the general meeting of the Club. Some of the regulations complained of, which differ from those of the Y. R. A., are embodied in the rules of the Club, and can only be altered at the general meeting. The Committee, therefore, had no power to change what was objected to, but they undertook to consider favourably before next year the wishes of the owners and to accede to them—i.e. we presume, to recommend the necessary alterations of rules—unless there were cogent reasons for not doing so. With this promise the yacht-owners, who, on their side, certainly showed no obstinate or unconciliatory spirit, were satisfied, and what threatened to be a painful dispute was brought to a satisfactory conclusion so far as the Royal Thames Yacht Club was concerned. The authorities of the New Thames Yacht Club were, however, apparently much more prejudiced in favour of their own rules, and much less disposed to grant fair demands than those of the older Club, who might naturally have been expected to be the more conservative of the two. The Committee did nothing, and the matches were in consequence deprived of all interest, while the Royal Thames had a fine entry for their great race. Of the difficulty which thus happily ended before this fine contest we should not now have spoken had it not been that precisely the same question as arose between the yacht-owners and the Royal Thames is now pending between the former and another great Club.

It is generally understood that the owners have laid before the authorities of the Royal Yacht Squadron their reasons for desiring a uniform code of rules, and that the matter is being considered by that body. Much is it to be hoped that the Committee at the Castle will show the same sense and moderation which were shown by the Committee in Albemarle Street. No one will accuse the latter of being too ready for innovation, or with disregard of precedent; but, without being in the least anxious for change, they have been able to recognize the necessity for change when it arose and the fair nature of the demands made on them. It is scarcely necessary to point out that no exception can be made in the case of one particular club, and that, if the Squadron is to insist on adhering to its own rules, any other club on the coast may do the same. The distracting variety of rules and the

great trouble caused by the different systems of measurement have long been complained of, and last season the evil became quite intolerable. It is to be hoped that the Committee of the R. Y. S. will not fail to see how much the prestige of Cowes will be injured if they simply oppose a *voluntus* to fair and temperate demands to which other clubs accede, and that the August races will not be made utterly tame by the absence of the best yachts.

The Thames races were, owing to this and other causes, very poor affairs. Had they been of interest we should have spoken of them before, but there was literally nothing to tell of, as the one match which promised to be exciting lost all its attraction from an accident which happened to the *Slouthound* before the start. The successes of the so-called ten-ton *Buttercup* created, it is true, some commotion, but they can hardly be considered as really remarkable, since it was in no way wonderful that a vessel of twenty-two tons' displacement, sailing in the ten-ton class, should win victories. The *Latona* is a justly-admired yacht, but the chance of the *Latona* would be small against a properly modelled and ballasted racer displacing three hundred and fifty-two tons of salt water. What the successes of the *Buttercup* truly proved was the injustice of the present rule of measurement and the possibility of taking enormous advantage of it. That this cutter is a good and well-designed vessel we do not for a moment deny, and indeed she proved it well in the race against the twenties and the *Maggie*, but in the ten-ton class she does not race against equals, and what has been done in building her might be done with equal success on a larger scale. If a capitalist, to whom a few thousands more or less were a small matter, were to build a big yacht with proportions as close to those of the *Buttercup* as racing waters allow, he would probably be able to hoist a considerable number of flags at the conclusion of each season—so long as the present rule of measurement remained in force.

The well-managed Harwich regatta, which, unlike some of the other regattas, happily occupied its usual place in the list of "yachting fixtures," was made terribly dull by Harwich calms, though the tiny breath of wind that blew for a short time was enough to show how much might be expected from Mr. Watson's latest achievement, the forty-ton *May*, a vessel not quite of the *Buttercup's* proportions, but still not modelled with reckless disregard of the venerable measurement rule. On the sail home the *Daphne*, a Clyde cutter, which has not done much before this season, achieved a remarkable triumph. She did not attempt to repeat it, however, in the match sailed on June 17th, for a prize of 100*l.*, very liberally presented to the Royal London Yacht Club by Sir Curtis Lampton. This race, sailed over a new and well-planned course at the mouth of the Thames, was in one respect of unusual interest, as the *Florinda* and *Latona* met for the first time this season. During the winter the latter yacht has undergone the same alterations as the *Florinda* underwent the winter before last—that is to say, she has had a considerable quantity of lead bolted on to her keel and her sail area increased. She did not at all distinguish herself on this day, as she was completely beaten by the *Miranda*, which came in considerably ahead both of her and of the *Florinda*, after sailing a very good race. Shortly afterwards, however, when there was more wind, the *Latona* showed how greatly she had been improved by judicious ballasting and increased canvas. Sailing against the *Florinda* in a strong breeze, she beat the renowned yawl by no less than thirteen minutes over a forty-four mile course, achieving a victory which seems likely to be succeeded by many others, for, in the magnificent race from the Nore to Dover, which took place on the day succeeding that of the match just mentioned, the improvement in her power of sailing was made, if possible, yet more manifest. Headed for awhile by the *Miranda*, she passed that vessel without difficulty when the sheets were got in, and beat in splendid style against a strong breeze with some sea from the North Sand Head lightship to Dover. If, however, her performance was calculated to increase the confidence in lead keels which is now so generally felt, that of another yacht, the *Samana*, which carries an enormous quantity of outside lead, was such, on the other hand, as to cause some scepticism. This cutter had considerable difficulty in passing the *Miranda*, and only came in some three minutes and a half ahead of her. The schooner, which, it should be observed, has also undergone treatment during the winter, sailed to perfection, and if the official times, which differ from those given in some of the papers, were correct, was within her time of both the cutter and the yawl, according to the Y. R. A. scale, and would, therefore, have taken the first prize had there been rig allowances. The Cinque Ports' yawl and schooner matches served to show still further how much better in a good breeze the *Latona* and *Miranda* are than they were. The former ran away from the *Florinda*, coming in a quarter of an hour ahead of her, and the sailing of the *Miranda* made it clear that when there is wind the *Egeria* has not a chance against her, for, strange to say, the smaller vessel drew away more and more as the wind grew stronger. It is worth notice that these fine contests were described in the *Times* by a reporter so profoundly ignorant of seamanship and yacht racing as to speak of the schooners as reaching out on the first round to a buoy, which the yawls sailing at the same time had to make a board to fetch, and to describe a yacht which in a strong breeze was nearly eleven minutes behind her antagonist at the finish as close in her wake.

Brilliant races were succeeded by a very dull one, as the sail to Boulogne and back was, owing to calms and light winds, a tedious

affair. The Plymouth regatta was spoilt by being fixed too near the Dover regatta, or, as perhaps would be said at Plymouth, by the unreasonable conduct of the Dover people, who insisted on keeping the racing yachts till the beginning of this week. On the first day the *Samana* sailed against the once famous *Nova*, and, of course, defeated her. On the second, with a light breeze just the right way for a cutter, she achieved a signal victory over the *Miranda*.

At Falmouth, in a light and very uncertain breeze, the *Samana* was again successful, while the *Latona* only saved her time on the *Miranda* for the second prize by two seconds. On Thursday the yawl and the cutter met in the Mersey the famous *Vandua*, which did not this year come south for the early matches. A strong north-westerly breeze was blowing at starting, and a flying start would have been feasible; but the Committee adhered to their programme, and in consequence, after being involved in some difficulties, the yachts got off in a very unsatisfactory manner, the *Samana* being well ahead and to windward of the *Latona*, and the yawl, in her turn, a long way ahead of the *Vandua*, and to windward of her. The first-named vessel held her lead through the narrow channel, and got close to the bar, where the sea was very heavy. Here her bobstay fell stranded, and she had to give up. The *Latona* made such bad weather of it, that she also had to turn back, while the *Coryphæe* and *May*, which had sailed for the forty-ton match, were of course obliged to follow the example of the larger yachts. The *Vandua* shortened sail when her rivals gave up, and allowed the tide to take her across the bar. She then duly sailed over the course, and, passing the flagpost a few minutes after five, gained one of the most remarkable of her many victories.

THE MONETARY CONFERENCE.

SINCE the Monetary Conference adjourned in May, it would seem that pourparlers have been set on foot, which ought to have been carried through before the Conference met. Two great Governments, like those of France and the United States, ought to have understood that a change in the monetary systems of the nations of Europe was one that could be made only by the Governments themselves. Such a change is not a mere question of political economy. It requires, of course, accurate economical knowledge; but it is a question quite as much of politics as of economics. It depends so much upon the habits of the people concerned, upon their feelings and even prejudices, and it also depends very largely upon the degree of economical development to which a country has attained, and, consequently, on the convenience of commerce. It would seem, therefore, to have been the proper course for France and the United States to have ascertained how far the several great Governments would go with them in rehabilitating silver. And this ought to have appeared more clearly incumbent when our own Government refused even the invitation to the Conference unless it was clearly understood that by accepting the Government committed itself to nothing. It would appear, however, that France and the United States were misled by the few eminent men in this country who have joined the ranks of the bimetallicists, and thought they could bring to bear upon our Government sufficient pressure to induce it to yield. They hurried on, therefore, the meeting of the Conference, and the result was that when the delegates came together, they found they were unable to agree upon anything. Their instructions were too vague and indefinite; and, as they had no authority in themselves to decide upon anything, they indulged in the vague discourses which have brought the Conference into not a little discredit. It became plain then to the Ministers of France and the United States that, unless the Conference was to become ridiculous, it was necessary to come to an understanding with the British Government. The prorogation, therefore, took place; and in the interval it would seem that serious proposals have been submitted to our Government, the answers to which are now being considered by the Governments taking part in the Conference.

It will be recollected that the Governments of Italy and Holland were willing to join those of France and the United States in establishing bimetallicism; that Switzerland and Belgium, on the contrary, inclined towards the single gold standard, and that Austria and Russia, being as yet unprepared to resume specie payments, were careful not to commit themselves to any definite programme. It was, however, to Germany and the United Kingdom that France and the United States looked to decide whether the Conference was to be successful or not. Our Government made known its decision, even before the Conference met, that under no conditions would it alter its monetary system. It offered, however, on the part of India, to enter into an engagement that, for a number of years to be agreed upon, India would continue to coin silver freely, as she has done in the past. Germany also made an offer upon its part. It would not give up the single gold standard which it had obtained at great cost, and after much trouble; but it would undertake not to sell any of its surplus silver for a period to be agreed upon by the contracting parties. When at last it should begin to sell silver again, it would further undertake to sell only such quantities as the market could absorb without a serious decline in price. Furthermore, it would leave in circulation no gold coins under the value of our own sovereigns, and it would re-coin its silver pieces of the same weight as the other circulating in the proposed bimetallic union; that is to say, such

silver piece should be 15½ times as heavy as its equivalent in gold. Lastly, it offered also to call in the Treasury notes which now circulate in Germany. In these several ways it would absorb a portion of the silver now lying idle, and it would also relieve the market for a definite number of years. The proposals of both India and Germany, though not quite satisfactory, were yet deemed such as would admit of further negotiation by France and the United States; but it was considered essential that England also should do something, and the difficulty was to find what that something should be. Our Government was quite resolved not to make any change in our monetary system, while France and the United States considered it necessary that it should do something to justify them in the eyes of their own people in adopting the bimetalism which they are anxious to establish. At last a proposal was made by one of the Spanish delegates which seemed to open the way to an arrangement. By the Act of 1844, which now regulates the management of the Bank of England, that Bank is given power to hold in silver one-fifth of the bullion which it keeps against its note issue. For a number of years the Bank has not availed itself of this permission, and Señor Y. Prendergast suggested that it should undertake again to hold the authorized amount of silver bullion. This, together with the Indian offer, would, in his opinion, be such a concession as the other Powers could accept from England. It would seem that this proposal was brought under the notice of our own Government, and by it was submitted to the Bank of England for consideration. The Bank is understood to have replied that it would be inclined to make the promise required of it provided the Governments of France and the United States, or either of them, would allow of the free mintage of silver. The Bank, as is well known, is bound to cash all its notes in gold. If, therefore, it were to keep a portion of its bullion in silver, circumstances might occur in which it would be absolutely necessary for it to change this silver for gold in order to cash its notes and give confidence to the note-holders. Unless, therefore, France and the United States, or either of them, stipulated to allow of the free coinage of silver for all the world, the Bank clearly could not undertake to keep an amount of silver bullion.

Three objections have been urged against this course on the part of the Bank, two of which appear to us to be absolutely devoid of weight. One is that it is calculated to give encouragement to the promoters of cheap money. Now this argument appears to us very much of a piece with the argument of the total abstinence people who tell temperate men that they should not drink wine because, by doing so, they give encouragement to drunkards. Surely men of business and men of affairs must guide their conduct by other considerations than these. They are too doctrinaire anywhere out of the schools. Besides the phrase—the promoters of cheap money—is itself open to exception. To attempt to make money cheap artificially is, no doubt, quackery, and ought to be discouraged; but cheap money in itself is a desirable thing, and, when it can be had, promotes trade. The second objection is that, as the Bank is dependent upon the undertaking by two foreign Governments always to keep their mints open for silver, it runs a risk in keeping silver which it is not justified in running. This argument would apply to such a multitude of transactions that it has no force in the case before us. Many bankers argue that United States bonds are really a better security than Consols, because they are largely dealt in, not only in London and New York, but in Amsterdam, Paris, Frankfurt, and Berlin as well; and that consequently, should a panic occur, it is scarcely credible that it would extend to all those markets at the same time; and, therefore, the holder of United States bonds would be able to sell them without much loss somewhere, whereas Consols have no market outside the United Kingdom. But United States bonds have value solely because of the general belief that the United States will observe the obligation to pay the interest and principal of its bonds when they fall due. It might, therefore, gravely be argued that no man is justified in holding United States bonds, because war or some other terrible accident might prevent the United States from fulfilling their obligations. Again, telegraph shares constitute a very large and valuable property widely held by the British public. There are telegraphs stretching across the Atlantic; there are telegraphs uniting this country with India, China, and Australia. In case of a war, it is quite conceivable that all these telegraph lines might be cut, and that the property might thus become valueless for years together. Are we then to be told that, because a war or some other catastrophe might render telegraph shares valueless, a careful investor is not justified in putting his money into telegraph shares? So we might go on through the whole list of Stock Exchange securities known as "international" and say that, under given circumstances, they might be rendered valueless. Nay, it is quite conceivable that even Consols themselves, in case of a war, might become unsaleable. Supposing the battle of Dorking were really to be fought, and that a foreign enemy were in occupation of London, it is probable that the interest on Consols would not be paid. Are we to say, therefore, the Bank of England, for fear of what might happen in case of a war, ought not to hold Consols? The argument, in fact, proves too much, and for that reason is of no force in the instance before us. France and the United States may safely be trusted to fulfil their obligations, save under circumstances when it will matter little what metal is held.

The one really valid argument against the proposal is, that the Bank of England is bound to cash all its notes in gold whenever

required, and if it holds in silver one-fifth of the bullion intended to cash the notes, it does not possess the means of fulfilling its obligations, supposing a run were to take place upon the Bank, and its notes to be presented in the course of a day or two. It is extremely unlikely, however, that there ever will be a run of this kind on the Bank of England. Such a run could only be conceived of if a foreign enemy had landed, and were marching straight upon London without the means of resisting it. And even then the run could be stopped by the suspension of cash payments and by declaring bank notes legal tender in all transactions, as no doubt would be done in the case supposed. Under all ordinary conditions, if free mintage were maintained by France and the United States, the Bank of England would be able—did it need to do so—to despatch its silver to Paris or the United States, send it into the mints there, and take gold in return. The Bank, therefore, is fully protected against loss by the condition upon which it insists that either France or the United States must maintain the free coinage of silver. Sir R. Peel carefully considered the point when framing the Act of 1844, and we see no reason for dissenting from the conclusion to which he came.

REVIEWS.

FRANCE AND THE FRENCH.*

WE intend neither an excess of honour nor an excess of indignity to Herr Hillebrand in comparing him to an historical character of greater notoriety, and also of greater intellectual and practical powers. He seems to have taken as his province the profession of going to and fro on the earth, and of walking up and down in it, and, when he finds himself in a given country, *il lui dit son fait*—which his prototype was a good deal too wary to do. The sense of a mission which he also has, and which his prototype was also much too sensible to have, attracts towards him sometimes dislike, but more frequently—and, on the whole, more justly—a good deal of ridicule. He shook the dust of Germany off his feet pretty early, but he has carried out his mission with regard to his native country in a manner which does not seem altogether to have recommended him to his countrymen. He has descended in a passing manner on England, and has done us the honour to read us lectures on our xenomania, the true character of our literary eminence, &c. These, when they were promulgated in this isle, raised inextinguishable laughter—due, doubtless, to ignorance—which rather drowned the sound of his predilections. He has of late established himself in Italy; and the Italians will, beyond question, one of these days have their history, present condition, and future fate expounded to them from the professorial chair of things in general to which Herr Hillebrand has elected himself by his own acclamation. But the major part of his observant faculties have been devoted to France, and the book now before us lays before English readers the result of his meditations on things and persons French. It has been noticed more or less cursorily in these columns in its other dresses; it deserves, perhaps, a fuller notice as it now presents itself, very well translated into English.

The plan which Herr Hillebrand has proposed to himself is tripartite. He gives his experience, and the opinions which he has drawn from that experience, and from the still more fertile source of his interior, in reference to social France, literary France, political France. He is most copious on the latter head; but his copiousness has to be reduced here by a sterner process than in either of the other cases. For Herr Hillebrand's book was written some three years ago; and the subsequent course of events, though it cannot be said to have rendered his political lumenbrations altogether worthless, has decidedly flown in the face of them. Herr Hillebrand is apparently a Bonapartist-Orleanist, regarding M. Thiers as the last hope of France, and such representatives of M. Thiers as M. Buffet and the Duke de Broglie as the second-best hopes now that M. Thiers was dead. France has neglected Herr Hillebrand, and has gone *tête baissée* into the system of government and policy most opposed to that which he favours. It does not, of course, follow that his review of her political position is valueless, but it ceases to possess for the time the great merit of actuality. Nevertheless, it has its interest. An acute, though ill-balanced and partially instructed, intellect manifests itself in all Herr Hillebrand's observations. Every now and then the acuteness gets the upper hand; every now and then the want of balance manifests itself most clearly. We shall not be suspected of regarding either M. Rochefort or M. Gambetta with undue favour; but a writer who in 1881 deliberately reproduces the following sentence, without qualification and without alteration, shows his fibre very clearly:—

It was at this time, too—1866—that the aristocratic *frondeurs* of the Liberal party smiled approvingly on the coarse attacks and indecent witticisms of a quibbling journalist called Henri Rochefort, and applauded the new so-called principle of irreconciliation, a clever invention of an obscure young lawyer named Gambetta, without ever considering that it is impossible to condescend to such alliances with impunity.

There is great wisdom in this remark, considered from one point of view; considered from another it can hardly be said

* *France and the French.* By Karl Hillebrand. Translated from the German. London: Trübner & Co. 1881.

to possess much. The opinion respecting the Ollivier Ministry which Herr Hillebrand afterwards expresses shows the secret of his inability to be a critic of politics. 'The four old parties,' he says, 'were represented in it by men of eminence.' Now, considering the fate which, according to the invariable experience of two entire centuries, waits on coalition Ministries, the mere fact which Herr Hillebrand mentions might have been sufficient to damn this particular Administration. On the other hand, when insight into the particular affairs of the moment is not required, Herr Hillebrand can sometimes write very justly. His comments on the revolution of September are excellent, and might be taken to heart somewhat further north than France:—

In Paris the solidarity of feeling between the country and the Government—I do not say the dynasty—is so completely lost that no one suspects it to be a cowardly or even a dishonourable act to desert a sovereign in the hour of misfortune, even when the misfortune has been brought about by the very men who desert him and who know that, had he been successful, they would have lauded him to the skies. . . . The curse of prolonged revolution is that it undermines every natural sentiment of generosity and devotion, and enables selfish passion and desire to prevail over the better part in man. . . . What matters country or national honour or the firm accord of rulers and ruled in evil times?

What, indeed? Another passage further on is an excellent expression of the wisdom which sometimes may be found in the most unpractical of politicians:—

General ideas and prejudiced opinions, a quantity of unverified catchwords, at best two or three principles of civil law, no knowledge of books, a certain amount of information gathered from reviews, and a vast deal of newspaper learning—such is the mental equipment of those who profess to govern a great Power like France and to represent her abroad.

Could not some of us narrate the fable with a slight change of name of other persons than the representatives of France? It is in these things—the general reflections of a man of some acuteness who has been for twenty years in actual contact with the things and persons of whom he writes that the value of Herr Hillebrand's contribution to the political history of France consists.

The social and literary parts of his work display rather different peculiarities. In the former, observation—unless the observer can be convicted of bad faith, of which there is no sign in Herr Hillebrand—is almost the first and last requirement which can be made of the witness. The author's general picture of French society and its characteristics is tolerably full, and, on the whole, very fair. In it, as in every picture of French society, the remarkable thriftiness of the Frenchman, and his tendency to *se cacher*, has great prominence. But it is odd that Herr Hillebrand does not bring out, as he surely might have done, the dangerous support which this general tendency lends, as a question of reaction, to the revolutionary and Bohemian tendencies of the nation which have done and doubtless will do it so much harm. Nowhere are there so many regular steady-going persons as in France, nowhere also are there so many *refractaires* and *déclassés*. The latter are simply the complement of the former. In consequence of the almost caste-like delimitation of professions and classes which Herr Hillebrand duly mentions, a man who for any reason drops out of one becomes at once a pariah. Politics and literature are the only second strings possible in France, and the latter usually has to be taken to very young, while in England, and still more in America, men may box the compass of the professions without either losing chance or reputation. A noteworthy part of Herr Hillebrand's book is his account of French education, which is very full and on the whole very accurate. If he is anywhere unfair, it seems to us to be to the professors of the provincial faculties. It is true that their work is anomalous; that they are very badly paid; and that they are not, as a rule, recruited from the highest classes. But the admirable literary work which has constantly been produced by them, and especially in the shape of the doctoral theses, upon which he is especially severe, seems to redeem the class, as a class, from discredit. These monographs are not unknown in Germany as well as in France, and there too they have sometimes produced good work. But while the German academic monograph is too often a piece of mere collation, useful enough in its way to literature, but entirely devoid of the least original or literary merit, the doctoral theses of the Sorbonne for the last forty years include some of the best and soundest literary essays that Europe has had during that period.

In literary criticism proper, Herr Hillebrand comes woefully short. He is altogether the man of a *parti pris*. The eighteenth century, according to him, was the *ne plus ultra* of literature in France, England, and (towards its close and the beginning of the nineteenth) Germany. The last forty years have witnessed a terrible, at least a "serious loss of intellectual culture." From this point of view he judges everything. Labiche and Sardou are not to be named in comparison with (whom does the reader guess?) with Scribe. Théophile Gautier is "a fellow who has given himself an infinite deal of trouble to cut some badly-coloured bits of glass, and perhaps a couple of coloured pebbles into a thousand facets." Edmond About is a scribbler. If he can praise anything it is the later French criticism which includes "Montégut's depth of thought, Renan's delicate taste and unsurpassed art, Taine's bold application of method and rich colouring, Sarcey's open-minded and unprejudiced judgment, and Scherer's thorough knowledge and honest endeavour to see things as they are." The omission of M. Paul de St. Victor is noteworthy, and it is still more noteworthy that almost every one of the tickets except M. Emile Montégut's, whom for a German Herr Hillebrand is fairly qualified to judge, is singularly inappropriate. M. Renan's delicate taste, as applied to

Béranger, M. Taine's method, which leads him to fall back on a helpless "J'aime mieux Alfred de Musset que Tennyson," M. Sarcey's open-minded judgment of anything, no matter what, that he does not like, and M. Scherer's honest endeavour to see Baudelaire and Ilderot as they are, compose a curious critical museum.

Herr Hillebrand's literary shortcomings, however, have been spoken of in these columns before, and need not be spoken of again at any length. His book is, on the whole, certainly an instructive one, because the testimony of a foreigner who has lived twenty years in actual contact with the life of any nation, not in a ghetto or a Leicester Square, is always instructive. It will add to the knowledge and correct some of the views of those who know France pretty well already. Whether it is altogether safe reading for those who have not the safeguard of previous knowledge is a point on which we should not like to pronounce by any means so decidedly. The author seems in a very curious way to have united the two chief defects of his original and his (for a long time) adopted country. He generalizes with the most perilous freedom, and he deduces with the most perilous fearlessness. He is thus rather an interesting person to watch in his evolutions from a distance than a safe guide in whose steps the blind and the lame may cheerfully tread.

JOHN INGLESANT.*

WE are glad to see that an interesting and remarkable book has been rescued from a position in which it could not do itself justice. *John Inglesant* first appeared, about a year ago, at Birmingham, where a hundred copies were privately printed, mainly for circulation among the friends of the author. Even under these conditions it attracted a good deal of interest and attention beyond the circle for which it was originally designed. But it deserved a larger audience than could be thus secured to it, and its publication at the hands of Messrs. Macmillan will now give it that launch into the world with which in these days no book, however good, can dispense. As the work of a Birmingham manufacturer, *John Inglesant* represents a degree and type of cultivation in our great industrial towns worthy of notice on many grounds. Its academic calmness of tone and purity of style, the amount of antiquarian and historical knowledge displayed in it, together with its pervading philosophic and poetic interest, have little in common with what the general mind supposes to be the brisk, practical, and dogmatic temper of business life. It is perhaps too much to say, diffused as cultivation now is, that the book has a special claim to notice on the ground of the circumstances of its authorship and appearance; but, taken in connexion with its real merits, these circumstances are certainly not without interest and significance.

John Inglesant is an historical novel, of which the full title runs thus:—"Memoirs of the life of Mr. John Inglesant, sometime servant to King Charles I.; with an account of his birth, education and training by the Jesuits, and a particular relation of the secret services in which he was engaged, especially in connexion with the late Irish rebellion and with several other remarkable passages and occurrences; also a history of his religious doubts and experiences, and of the Molinists or Quietists in Italy, in which country he resided for many years, with an account of the election of the late Pope, and many other events and affairs." The book professes to be the mere collection of a series of papers relating to the life of a Royalist during the stirring times of the Civil Wars and the Commonwealth. It is not a novel in any proper sense. Mr. Shorthouse calls it a romance, perhaps in remembrance of Hawthorne, with whom it was a favourite title. The word seems to suggest to him, as it undoubtedly did to Hawthorne, a greater latitude of poetic and imaginative treatment than is ordinarily allowed by association to the novel proper. As in *Transformation*—Hawthorne's romance *par excellence*—so in *John Inglesant* the interest of the book lies in delicate study of character under romantic and unusual circumstances, while the glowing Italian landscape in which two-thirds of the story is framed was probably chosen for the same reasons as led Hawthorne to construct a kindred background against which to set the weird conception of Donatello. The subject of a romance, as Hawthorne understood the word, is addressed rather to the few than to the many, and appeals to a more subtle and unusual range of feelings than are ordinarily stirred by a novel. Therefore it may, and ought to be, clothed in a more highly-coloured and poetic form than tradition allows to the novel; it may, too, be more discursive. This, at any rate, seems to be the way in which Mr. Shorthouse has understood his title, and the reader who makes this plain to himself beforehand will be tolerant of the weakness he shows in some of the most necessary qualities of the novelist proper. The book has two themes, one artistic, the other argumentative and philosophical. The author's leading idea seems to have been to trace the effect of a great time of political and speculative ferment, such as was the seventeenth century in England, upon a sensitive, finely-wrought nature, deeply veined with religious mysticism, fervent, devout, tenacious, and yet crossed with a certain fatal feebleness, partly traceable to physical, partly to moral, causes. Mingled with and dependent upon this first theme is the second, which may be described as a defence of the Church of England, ideally conceived as the halfway-house and meeting-place of the religious and rationalising instincts in man, against the great mother Church

of Rome, of which Inglesant is made at all times to feel the strange potency and force, and which he only escapes joining by an accident. The first theme, with its Hamlet-like intricacy and suggestiveness, has been, on the whole, admirably worked out by Mr. Shorthouse. The second has escaped in his hands from the commonplace which might have seemed inseparable from it and has inspired some of the most beautiful writing in the book. But it is not as closely knit to the character of John Inglesant as it should have been. It ought always to have been presented to us through the medium of Inglesant's personality, if it was to evade the objections so easily brought against the introduction of such a theme at all into a piece of high imaginative work. As it is, Inglesant's final declaration in favour of the Church of his birth takes us by surprise instead of developing itself naturally out of his past history, so that we are tempted to quarrel with the last page of the book as inconsistent and out of place, when taken by themselves they contain one of the most attractive descriptions ever written of the philosophical position of the Church of England. A little more thought and trouble might have avoided this, and produced a more perfect artistic whole.

John Inglesant is the grandson of one Richard Inglesant, to whom the suppressed Priory of Westacre had been assigned under Henry VIII., and whose mixed character with its opposing strains of scrupulosity and worldliness is very delicately sketched in the few pages which describe his entry upon the property of Westacre. Both he and his son, also Richard Inglesant, succeed in steering a safe course through the perilous days of Mary and Elizabeth, remaining Catholic at heart, but always conforming sufficiently to the prevailing *regime* to win the favour and disarm the suspicion of the party uppermost. Under Charles I. this Right Centre position wins for the second Richard Inglesant an unusual amount of influence upon politics. His house at Westacre becomes the shelter of the proscribed Catholic priests, and mass is secretly said at midnight in the Priory chapel, while at the same time he manages to stand well with the High Church party and the Court. His younger son is very early marked out by the men surrounding his father as a convenient instrument of diplomacy and intrigue. His meditative religious temper, his plant imaginative intellect, become the prey of the Jesuit, Father St. Clare, then at the head of Catholic intrigue in England, who sees in the dreamy boy, with his passion for reverie and Platonic speculation, an admirable future agent in the expected drama of reconciliation between England and Rome, which is to be brought about by the combined action of the High Church, Royalist, and Catholic parties. John Inglesant accordingly grows up a member of the English Church, and as such allowed a much freer walk in speculative paths than is possible to a Catholic, but at the same time devoted both by temperament and habit to his Jesuit master. When he arrives at manhood, he is placed about the Court, and bidden to make it his business to become acquainted with ~~men~~ of all parties. The march of revolution, however, scatters into thin air the webs of intrigue upon which at one time so much had seemed to depend, and, while the Catholics are still debating whether they shall work through or against Laud, comes the execution of Strafford and the beginning of the end. Inglesant's life at Oxford with the Court is in many ways admirably described, though here as elsewhere there is an entire absence of humour, which, employed as Thackeray would have employed it, might have done good service in lighting up all the by-passages of the story. We find him present at Edgehill and Cropredy Bridge, and standing by Laud on the scaffold in his capacity of confidential agent alike of the King, the Catholics, and the Laudians. Then follows the account of Inglesant's share in the fatal negotiations with the Irish rebels, which is perhaps the most successful piece of narrative in the book. He is sent as the King's secret agent to Ireland, to hurry on and complete the negotiations between Glamorgan and the Irish Catholics for the despatch of an Irish contingent to the relief of Chester, then besieged by the Parliament. He goes, knowing that the scheme of letting loose the Irish rebels upon England will be regarded with horror even by the Royalists themselves, and that if it miscarries the King will disavow the whole plan and leave his agents, small and great, to bear the penalty. The plan of course does miscarry. Glamorgan is arrested in Dublin on a charge of treasonable conspiracy, the King deserts him, and Inglesant, falling into the hands of the Royalists at Chester, boldly disowns the King's own written commission, and, disgraced with Royalist and Roundhead alike, is given up to the Parliament.

To follow out the subsequent events in detail would take us too far afield. Inglesant's mock execution, his heroic loyalty to a faithless master, his suffering of mind and body under the position of infamy from which he is gradually rescued by the growth of a truer knowledge of the King's character and objects, are drawn with a skill and pathos beyond praise. When Inglesant finally emerges from the Tower, Charles I. is no more, and Inglesant's special work in England is gone. It may be noticed as remarkable under all the circumstances that Mr. Shorthouse's sympathies are decidedly Royalist. Charles's follies and weaknesses are made use of with unsparring effect; but in the description of both the King's inner nature and outward history, the reader is made to feel the "pity o't" more than anything else, and is led to regard his character and circumstances as double aspects of a relentless fate for which he is scarcely responsible.

A new departure in the book is reached in the murder of Inglesant's only brother, which occurs immediately after his release from the Tower. Thenceforward we find, thwarting the religious impulse, which, as the book proceeds, asserts itself more and

more in Inglesant's life and character, not only the old inherited weakness of will and conscience, but a new force of revengeful passion, complicated besides with physical injury resulting from a sabre-cut on the head in one of the Civil War skirmishes. The scene of the story is transferred to France and Italy. Inglesant, still nominally the agent and *protégé* of the Jesuits, wanders from place to place, driven on the one hand by the hunger for ideal good which had sprung up in him in his Plato-worshipping youth, and on the other by the hope of finding and destroying his brother's murderer. In the course of his journeyings he is brought across men and cliques who represent the central continental influences, just as in England he had been brought across men and cliques representing the main currents of English thought and society. He falls in love and marries a shadowy being with a merely shadowy relation to him; he assists at a Papal conclave; and finally, on a morning ride over the Apennines, he meets the murderer of his brother face to face, and, driven by the murderer's appeal to the holiest names to forego the vengeance he has been so long planning, hands him over to the unalterable Divine vengeance in a passage full of exquisite force and beauty. A description of the plague in Naples, and of Inglesant's share in the attempt of Molinos and his followers to plant Quietist principles in Rome, winds up the Italian section; and in a concluding letter, supposed to be written some years afterwards by a chance acquaintance, we are allowed a glimpse into Inglesant's later life in England under the Restoration, and into his opinions on the then burning questions of the rival claims of the Church of England and the Church of Rome, and the vital religious facts underlying and determining them.

Such are the main outlines of a book which can claim but very little on the score of construction, as we commonly understand construction in a novel. The plot of the whole latter half drags, and is hindered and confused by episodes, some of them interesting, others pointless and tedious. The turning-point of this part—the moment when Inglesant first gains direct information of the murderer Malvolti—is slurred over in a singularly careless and ineffective manner; the incident introduced often wants edge and shape, and the stray characters, of which there are too many, are far too apt to talk in the same key and phraseology. There is no female character in the book of real importance. Mary Collett is a beautiful sketch, successful because it has a definite place in what we may call the inner plot of the book for which Inglesant's character and motives provide the material. But Lauretta, who, properly developed, might have given life and form to the latter portion of the story after Mary Collett's death, is neither a beautiful nor an effective sketch, and Inglesant's relations to her—which with such a man would have been intense in themselves, and important in their influence upon his development—are scarcely thought out at all. Here is the great failure of the book as a study of life. We have compared it with *Transformation*. The characters of Mary Collett and Lauretta, as well as some others—notably that of the Jesuit, Father St. Clare, who recalls Father Holt—lead one to compare it with *Emmond*. Beside the brilliancy and finish of the two great pictures in *Emmond*—Lady Castlewood and Beatrix—the whole character-drawing of *John Inglesant*, outside the character of Inglesant himself, appears flat and tame. But the book must be judged on what it gives rather than on what it withholds; and if it had much less to offer than it has, much less charm of style and description, and many fewer pathetic and touching incidents, the character of John Inglesant alone would win for it a sympathetic circle of readers. In the creation of this character, at once weak and dignified, pleasure-loving and ascetic, Mr. Shorthouse has shown great knowledge of many of the deeper and less commonly analysed forces of human thought and feeling, and an unflinching tact and skilfulness in describing them. The mystical element in the book might easily have been carried too far. As it is, he has never allowed it to jar upon the reader, while it gives warmth and colour to what would otherwise have been dry philosophical discussion. The book in fact seems to embody in artistic form, views and ideas well known to those who are conversant with what one may call, for want of a better phrase, academic High Churchism. The peculiar religious tone and temper which belonged to the finer and more poetical minds in the Tractarian movement, and which is still noticeable among us both within and without our Universities, finds here delicate and beautiful interpretation.

EGYPT, ANCIENT AND MODERN.*

A HISTORY of ancient Egypt, and an account of its antiquities, especially such an account as should present to the reader's eye as well as his mind a complete picture of the manners, arts, and religion of that extraordinary people, was a want which had long existed, and which Canon Rawlinson has at length worthily satisfied. The land of Egypt plays so important a part in sacred and profane story, and its civilization is so ancient that it possesses an interest quite apart from and beyond that which attaches to any other land. Another great claim which it has upon our consideration is its connexion with the incidents and scenes of

* *History of Ancient Egypt*. By George Rawlinson, M.A. 2 vols. London: Longmans & Co. 1881.

Egypt. By Stanley Lane-Poole. "Foreign Countries Series." London: Sampson Low & Co. 1881.

sacred history, and this it owes almost exclusively to its geographical situation. The desert of et Tih, "the wilderness of the wanderings," separates Egypt from that strip of fertile land, Palestine and Syria, which intervenes between the Eastern Mediterranean and the Syrian desert, where she encountered in turn her doughty enemies the Emim, Rephaim, Philistines, Canaanites, Israelites, Hittites, and Jews, who disputed with her the road to the broader and richer regions of Mesopotamia, Assyria, and Asia Minor, the seats of civilizations as ancient, and of wealth as great, as her own. For twenty centuries the struggle went on between Egypt and her Syrian, Assyrian, Babylonian, and Persian rivals, and Palestine was ever the highway which her forces traversed, and the Euphrates at Carchemish the field on which they tried their strength. Of these struggles Canon Rawlinson tells the history in a succinct and pleasant style. The work opens with an exhaustive description of the physical geography of the country, as well as of its animal, vegetable, and mineral products, together with a well-written and scientific account of its ethnology. The prevalent idea that the Egyptians were originally a colony from Ethiopia is refuted by the fact that they have none of the peculiarities of African tribes, their hair being straight and not woolly, and their complexion dark, but red rather than black, while their features, though neither Arab nor Syrian, bear a certain resemblance to both these types. The monuments also afford another proof that the immigration of the ancient Egyptians was from Asia, and not from the south, the most ancient temples and pyramids being found in the north. Although inferior to the great European races who succeeded to their empire and superiority, they possessed high intellectual powers, and cultivated literature, science, and philosophy at a very early period, while in art, and especially in architecture, they reached a very high point of excellence. They were not wanting in manliness and military spirit, but they were too much addicted to luxurious living and sensual indulgences.

The language of ancient Egypt was "an agglutinate monosyllabic form of speech," presenting analogies both with Turanian and Semitic tongues, the Semitic element, however, predominating; the Coptic is its legitimate descendant, and, although a dead language now, continued to be spoken in the Nile Valley until the seventeenth century. It was mainly through the means of Coptic that such accurate and certain results have been obtained from the investigation of the ancient records. Of the language and the hieroglyphic writing, as well as of the more cursive hieratic and demotic hands, the reader will find in the work under notice a very clear and practical account, freeing the subject from the many technical difficulties which surround it, and smoothing the way for a study of the monuments themselves.

Equally interesting is the account given us of the literature of old Egypt which has been preserved in these ancient documents. The history, whether as recorded on the monuments or written in books, was stilted and uninteresting in style, although of course bristling with facts of the intensest interest; poetry was more advanced, and was, like that of the Hebrews, chiefly characterized by its delighting in parallelisms and antitheses, while it was superior to the latter in its rhythmical arrangement. Romances, travels, and collections or models of epistolary correspondence are also found in abundance; but they are almost childish in their simplicity. One marked feature in the more highflown Egyptian compositions was the arbitrary and frequent change of person employed; and this peculiarity, it is curious to note, is also of frequent occurrence in the Koran. Books on geography, astronomy, astrology, magic, calendars, catalogues of libraries, &c., are found in large numbers, so that the materials for compiling an exhaustive account of the people and their civilization are sufficiently ample; but, looking at the cryptic character of the documents in which they are enshrined, we cannot be too grateful for so popular and scholarlike an epitome of the facts as these volumes afford. Examples are given of the most important of these various styles of composition, and very curious and interesting reading they make. The account of the agriculture, products, and revenue of Egypt under the Pharaohs is instructive, especially at the present time, as giving an idea of the immense capabilities of development which the resources of the country possess. The chapter on architecture will also be read with interest, and the description of the construction and scope of the pyramids, obelisks, and temples leaves nothing to be desired. The British Museum contains enough specimens of the different types of Egyptian statues and statuettes and pictures to enable us to judge of the progress which the ancient people had made in sculpture and painting, but the student, as well as the artist, will be grateful for the excellently drawn and arranged illustrations of this subject with which the author furnishes us.

The religion of Egypt and its relation to that of the Jews, as well as to the various pagan cults of the old world, is one of the most absorbing studies connected with the investigation of the ancient monumental records and papyrus documents. The Egyptians were profoundly religious, and the devotion of the people was the one thing which made the greatest impression upon Herodotus when, in the middle of the fifth century before Christ, he visited the country and gave to the world the most entertaining and most instructive work which has ever perhaps been written. The temple was the most prominent building and the centre of life in every Egyptian city:—

A perpetual ceremonial of the richest kind went on within its walls, along its shady corridors, or through its sunlit courts; long processions made their way up and down its avenues of sphinxes; incense floated in

the air; strains of music resounded without pause; all that was brightest and most costly met the eye on every side; and the love of spectacle, if not deep religious feeling, drew to the sanctuary a continual crowd of worshippers or spectators, consisting partly of strangers, but mainly of the native inhabitants, to whom the ceremonies of their own dear temple, their pride and their joy, furnished a perpetual delightful entertainment. At times the temple limits were over-passed, and the sacred processions were carried through the streets of the town, attracting the gaze of all; or, embarking on the waters of the Nile or of some canal derived from it, glided with stately motion between the houses on either side, a fairer and brighter sight than ever.

Nor was the influence of religion confined to the outer life of the people, it permeated their whole being; literature and science were little more than branches of theology, arts were but subservient to the glorification of some god, and sacerdotal regulations prevailed in even the smallest details of daily life. The religion of Egypt, like that of most of the nations of the ancient world, presented two phases—an exoteric aspect, as it appeared to the outside world and the common people, and an esoteric one, which it wore to the initiated and learned. The first was a polytheism, or rather an animal worship of the grossest character; the other was a system of strict monotheism, intimately bound up with philosophical speculations upon the nature of God and the destiny of man. The gods of the popular mythology personified the various powers and operations of nature, but were recognized by the illuminati as the attributes of the one indivisible, creative, preservative, and destructive power. Such, at least, is Canon Rawlinson's charitable conclusion, supported by strong arguments deduced from facts and analogy; but we must confess that a perusal of his pages on the mythology of the Egyptians leaves a strong impression on our mind that they were, after all, irreclaimable pagans; and, however prettily they might theorize, stuck to their direct worship of stocks and stones and cats and dogs with as much secret, though real, attachment as does the Jamaica "nigger," who, after fifty years of exemplary life as the deacon of a Methodist congregation, dies with an Obi fetich hung round his neck. But certain it is that they had evolved what is, after all, the most important worldly function of religion—namely, a code of political and domestic morality which was far in advance of other peoples of antiquity. One advantage, however, of reading Professor Rawlinson's minute account of this religion will be to remove the prevalent notion, of which sceptical writers are so fond of taking advantage, that the Mosaic Commandments and the doctrine of the Trinity are directly borrowed from Egyptian sources. The origin of the animal worship has been the subject of the most conflicting speculations; and the author appears to us to have taken the most sensible and likely view of the matter when he attributes it to the exaggerated symbolism which began by tracing in certain animals resemblances to certain attributes of the divine nature, and proceeded at length to assign to various Deities the heads of these animals and even their entire forms. Like most ancient cults the religion had a grossly indecent as well as a gloomy superstitious side; yet on the whole it appears to contrast favourably with other forms of paganism. The subject of the Egyptian mysteries is an extremely attractive one; but Canon Rawlinson candidly informs us that there is nothing authoritative to be said upon the subject, and wisely abstains from mere speculation.

We have not space to do more than refer to the admirable description of the manners and customs of the Egyptians, their arts, trades, amusements, and other occupations; suffice it to say that it forms not only a valuable ethnological study, but a trustworthy explanatory guide-book to the pictorial representations found upon the walls of the ancient tombs and temples in the Nile valley and now familiar to all through museums and books.

The second volume, which deals with the actual history of the people, is in no way inferior in interest to the first. The chronology is, and always has been, an initial difficulty in the matter, and even with the researches of later times to guide him, the historian can speak with but little certainty about the order and date of the Kings of Egypt whose names have come down to us. The history seems, however, to divide itself into three great divisions—the "Old Empire" of Manetho, which is the oldest presentation of civilised man which the world contains, and much of it certainly anterior to Abraham; the Middle Empire begins about B.C. 1840, lasting for two hundred years; and the "New Empire," beginning at B.C. 1640, comes, after the Twenty-second Dynasty, upon the field of exact and well-ascertained dates.

Of course the chief points of interest in this part of the work for European readers will always be those where it comes into contact with the familiar history of the Bible. The story of Joseph, the Exodus of Israel, and the invasions of Palestine will always form the most attractive portions of the narrative. The conquest of Egypt by the Hyksos, or Shepherd Kings, who seem to have been principally Canaanites, with a preponderance of Hittites among them, was the first act in the drama. After devastating the country, and committing great havoc among its monumental and literary records, they gradually adapted themselves to Egyptian institutions, and at length laid the foundation of a new and prosperous empire. Apepi, the last monarch of the dynasty, is supposed to have been the Pharaoh of Joseph. With the accession of the native king, who drove out the Hyksos, the troubles of the "Shepherd" immigrants, now naturalized in Egypt, began, and culminated in the oppressions with which we are so familiar, and in the Exodus, which was to prove so important an epoch in the history of the

world. The version of this and the other incidents which bring Egyptian story in absolute contact with the Bible narrative may be studied with great advantage in Canon Rawlinson's pages, where all the facts which modern research has brought to light are clearly and impartially set before the reader. As a specimen of the mass of miscellaneous and amusing facts which these volumes contain, we cannot refrain from calling attention to the description of the discovery of a plot against the life or crown of Rameses III., and the punishment of the criminals, the men being condemned to the Japanese punishment of death by their own hand, and one of the women conspirators of high rank being sentenced to keep a beer-house by way of penal servitude. The *History of Ancient Egypt* is a work of great erudition and of profound and well-sustained interest.

To those who require a handbook to Egypt, as it is at the present day, Mr. Stanley Lane-Poole's little work will be very welcome. It is a clearly-written account of the geography and physical aspects of the people and their daily life, and of the modern history, economics, and administration of the country. Although wanting in that graphic character which personal acquaintance with the scenery and surroundings alone can give, it is a useful and meritorious compilation.

THE SONNETS OF CAMOENS.*

THE *Sonets* of Camoens, after having been comparatively neglected in favour of his famous epic, have found in our own days a careful and judicious commentator in the Visconde de Juromenha, who has edited them all, to the number of two hundred and fifty-two. They are the principal compositions of their kind in the Portuguese language, for since the sixteenth century no really important lyric has arisen in Portugal; and the sonnets of Ferreira, which preceded those of Camoens, and have sometimes been compared with them, are altogether too harsh and pedantic to support the comparison. It is therefore to the general literature of Europe that we must go for a parallel to these poems, which may roughly be said to hold the same relation to the sonnets of the Italians as is held by those of Spenser and the pre-Shakespearean sonneteers. There is the same intellectual bondage to certain laws of pastoral diction and an elaborate artificial system of courtship, curiously mingled with the same occasional outbreaks of rebellion against that bondage. Camoens, who is as far from the rosy classicism of Ronsard, on the one hand, as he is from the profundity of Campanella or the religious eroticism of Itedi on the other, is really more closely allied to Spenser as a sonneteer than to any other European poet, and there is not in these formal compositions scope for those peculiarities of individual style which make the *Lusiads* so unlike the *Fairy Queen*. The great Portuguese poet's epic is certainly a more vigorous poem than the allegory of his English contemporary; it is more breezy and spirited, and a larger conception of life moves in its heroic pages. At the same time the lover of poetry pure and simple, the man who likes to forget the world and all its cares, will turn to Spenser with more enthusiasm than to Camoens, since to Spenser, first among European poets, was revealed the dogma that has enabled poetry to live in the charged atmosphere of modern life, and which Keats has put into immortal words:—

Beauty is truth, truth beauty—this is all
Ye know on earth, and all ye need to know.

In his sonnets Camoens comes much nearer to that Spenser who was so pre-eminently the lover of natural beauty, while Spenser, curiously enough, in his sonnets, approaches what was dry and mannered in the Southern poetry of his generation. A deep sincerity, a tender *nostalgia* after love and home, a glowing patriotism, give life and interest to a great number of those quatrains with which, as Wordsworth says, "Camoens soothed an exile's grief." The Portuguese language, the fluency and sonorousness of which have been snares in the path of lesser writers, attains a wonderful smoothness and fulness on the lips of this great master of language, and most of his sonnets are distinguished as much by their melody as by their serene and limpid expression.

Mr. Aubertin, who is the author of the best existing English translation of the *Lusiads*, and whom long official residence in Portugal has made a master of the niceties of the rather difficult language, has not attempted to translate all the 252 sonnets, but has selected seventy from among the number. His version is, on the whole, interesting and accomplished; if he fails, it is mostly in seizing the subtle shades of meaning that give value to the original. For instance, in translating the exceedingly touching sonnet on the death of the lady whom Camoens loved in India, and who was drowned, Mr. Aubertin translates

Etornamento as águas lograrão
A tua peregrina formosura,

by

The waters in their cold embrace shall bind
For evermore thy rarest cynosure,

where "cynosure" seems to us an affected word out of place in this connexion, and where the delicate meaning of "peregrina formosura," a beauty at once unusual and exotic, is lost. On the other hand, Mr. Aubertin is sometimes extremely happy in render-

ing those curiously blunt ingenuities which are characteristic of Camoens, as where he translates

O subtil invenção para seu dano

by

O stratagem to his own prejudice,

than which nothing could be better.

But it is time to give an instance of Mr. Aubertin's powers in an entire sonnet, and we turn, therefore, to his rendering of what is perhaps the grandest of the whole series, that written by Camoens, with an unusual majesty of expression, when the bones of King John III. were removed in 1572 to the Monastery of Belem. We will first quote the Portuguese original, that our readers may form some idea of its singular dignity and melody:—

Quem jaz no grão sepulchro, que descreve
Tão illustres signaes no forte escudo?
Ninguém; que nisto, em fim se torna tudo:
Mas foi quem tudo pôde o tudo teve.
Foi Rei? Faz tudo quanto a Rei se deve:
Poz na guerra e na paz devido estudo.
Mas quão pezado foi ao Mouro rudo,
Tanto lhe seja agora a terra leve.
Alexandro será? Ninguém se engane:
Mais que o adquirir, o sustentar estima.
Será Hadriano grão Senhor do mundo?
Mais observante foi da Lei de cima.
He Numa? Numa não, mas he Joane
De Portugal Terceiro sem segundo.

Mr. Aubertin's version is as follows:—

Who lies in this great sepulchre that shows
Signs so illustrious on the valiant shield?
No one; for to this end all things must yield:
But he did all and could all: as he chose.
A King? he wrought what King to self King owes:
He studied arts of peace and of the field:
Heavily as the rule Moor's fate he sealed,
So lightly on him now may earth repose!
Is't Alexander? you mistake the man:
Rather he loved to keep than to acquire.
Is it the world's great master, Hadrian?
He held the sacred law of Heaven far higher.
Numa? It is not Numa, it is John
Of Portugal, the Third: second to none.

This is certainly a conscientious attempt to give the original phrase for phrase, and it is not unskillfully performed, especially towards the end; but "he wrought what King to self King owes" is a terribly awkward and almost unintelligible way of saying "he did all that a King owes it to himself to do," and "without a second" is a very different thing from "second to none."

A more favourable example of Mr. Aubertin's skill may be given in the version of one of the amorous sonnets in which, under the poetical name of Liso, Camoens seems to lament the unfaithfulness of one of those pastoral loves with which he tried to solace himself after the death of Catarina de Athaide. It is at least only humane to suppose that the "Senhora minha," whose unkindness is here so bitterly deprecated, is not the same as that lady whose tomb at Cintra has attracted so many worshippers as the sepulchre of the very Phoenix of fidelity:—

The swan, when feeling that its hour is o'er,
And that the moment's come when it must die,
Lifts saddest voice and sweetest harmony,
Along the lone and solitary shore:
Desires its life prolonged a little more,
And leaving its existence with a sigh,
And fondest longing of a last good-bye,
Doth this sad journey's coming close deplore.
E'en thus, my Fair, when I was doomed to see
The mournful end that all my loves befell,
While on the last remaining point I strove,
With all my sweetest song and harmony
Upon thy cold unkindness did I dwell,
On all thy treacherous faith and on my love.

In his preface, which is rather wordy and tedious, Mr. Aubertin shows that he is a better translator than critic. Instead of giving us some bibliographical or historical account of the sonnets of Camoens, he divorces into a rambling disquisition on the sonnet in general, which he treats in a manner that we fondly hoped had become antiquated. Being a good translator, he has not ventured, except in one or two instances, to alter the sequence of Camoens's rhymes; but he groans aloud over the vexations of the task. Moreover, he seems to have employed an amanuensis who played to him the same part as was played by the ingenuous little boy in Andersen's story of "The Emperor's New Clothes." He and his learned friends were all bowing down before the imaginary beauty of Camoens's regular sonnet-form, when this fresh child of nature exclaimed, "They all seem to finish before one has got to the real end of them." The scales immediately fell from Mr. Aubertin's eyes, and it was revealed to him that the ear of the natural man demands a couplet at the end of a sonnet. A "delicate adagio conclusion" is all very well, but the melody is really incomplete without the "hammer of the coda." Like the oratory of Agib, Prince of Tartary, "this is pretty, but we don't know what it means," and, judged simply as criticism, it seems to us remarkably poor. In point of fact, while Mr. Aubertin has been listening to his amanuensis, and getting into a tangle with adagios and codas, he has missed a very pretty opportunity of discoursing profitably to us on the sonnet. For it would be difficult to find a better text on which to preach a sermon on this subject than the practice of Camoens, who hits a happy mean between the rigid inflexibility of the Petrarchans and the laxity,

* *Seventy Sonnets of Camoens; with Original Poems.* By J. J. Aubertin. London: C. Kegan Paul & Co.

and positive error of the Elizabethans. If any one wants to know how sonnets should be composed, from a technical point of view, let him go to Camoens; he cannot find a better master. The great principle on which the normal sonnet is constructed is this—an advance uphill in dignified array for eight lines, and then a retreat downhill, more at ease, for six lines. The octett is a rigid form not to be tampered with; its rhymes are two, and in every case must be arranged *abba*, *abba*. But the sestett need by no means be so exact in the distribution of its rhymes; after “swelling proudly,” as Keats says, up to its climax, it may retire in some measure of elegant disarray, without losing its character as a regular form. Camoens, whose octetts are without variation, gives himself this license in the sestett, altering the order of rhymes with subtle art in accordance with the feeling to be expressed. His most usual arrangement, for pastoral and amatory sonnets, is *c d e, c d e*; in some cases a fuller and more melancholy music is secured by the more frequent rhyme, *c d e, d e d*, or even, though this is very rare, *c d e, c d e*. In no single instance does he permit himself to use a couplet at the end, and to the student of poetic form his sonnets are particularly interesting, because they are in every case regular, without being unreasonably rigid. We speak with confidence of a certain form of sonnet being “regular” or “normal”; we do not on that account deny that an abnormal or irregular sonnet may be an exceedingly beautiful poem, but we wish to protest against the fatuous criticism which says that because “Bright Star, would I were as steadfast as thou art” is a very exquisite poem, there is no such thing as an irregular sonnet.

THE LYRICAL DRAMA.*

IN the estimation of the public in general the production of a successful opera ought to be the highest object of a composer's ambition; and, taking the civilized world all round, it is the kind of musical entertainment out of which people suppose themselves to get the greatest amount of enjoyment. In this country, however, up to the last few years, no very great amount of attention has been paid to the quality of the music except as regards its fitness for showing off Italian or Italian-taught singers. The audiences, proud of their expensive exotic, and saved thereby from being bored with what was not good, were not driven to inquire after what was so, or what made one work differ from another in glory. But in the last few years art has begun to receive more serious attention. A certain number of people who are more alive than their fellows have grown insensibly to feel the irksomeness of the monotonous void of star performances, and have been driven to inquire into the causes of their dissatisfaction. Many really musical people are rarely to be seen within the walls of either Italian opera-house from year's end to year's end, because when they go they have to submit to so much that is objectionable that even the rare offer of an interesting work can hardly surmount the distaste which has been forced upon them. This, of course, must appear a singular anomaly, and among apologies for opinions extorted from wise men by the vulgar, and much chatter among little artistic sets, and frequent hints at questions and theories in literature of all sorts, the public gets wind of artistic problems, and grows to a certain extent insensibly wiser. But wisdom does not grow upon the hedgerows, and so it happens that these ideas which float about and get hinted at here and there want the patience and devotion of some capable person to put them into intelligible and consecutive order, and to make the public, who are not by any means really unwilling, see clearly where before was nothing but dim glimmerings, which might possibly be will-of-the-wisps. It is, indeed, a most favourable opportunity for such a work; for the searchers after facts have accumulated an enormous amount of varied and particular information, which almost cries out to be sorted and made fruitful; and the subject is certainly one which people at the present day are quite ready for, while it has in itself elements of remarkable human interest, which only need moderate experience and a good head to turn to serious and most satisfactory account.

In these circumstances, the appearance of a work called *The Lyrical Drama* must be welcome to numbers of anxious, and yet uncertain, lovers of art. The very title looks suggestive; as if the writer had considered that the word opera, for all its great associations and connotations, was, after all, not quite adequate to express all that is wanted to come under it. The first chapter, called “Operatic Origins,” looks equally promising, for it suggests going to the root of the matter. Reading a few pages gives the impression that the style is light and chatty, but that there is evidently a good deal of information at the back of it. People who do not know anything at all will be possibly wiser for the writer's expressing his dissent from the students who believe that Greek plays were forerunners and counterparts of modern opera. They will also be struck by the fact that the story of Orpheus has had great fascination for composers, from Poliziano, in the fifteenth century, to Peri and Monteverde a little later, on to Gluck, and so down (in both senses) to Offenbach; but perhaps in that respect they will not be much the wiser. It certainly is desirable that they should know that Venice held a very remarkable position in relation to the earliest attempts at

modern opera, and they might with advantage know more than they will extract from the present chapter. They will be struck with Lully's being called “an Italian scullion and violinist,” and with the exceptional privileges accorded to him by Louis XIV., which probably resulted in the removal of his rival Cambert to England, who, arriving there with his own opera, *Ariane*, in his pocket, got it performed, and thereby gave a notable spur to such entertainments. Readers of Pepsys will be pleased to come across the familiar *Siege of Rhodes*, and students of humanity will be interested to read that Cromwell and the Puritans allowed opera when they forbade all other dramatic representations, because they considered that the public of that day, like that of the present, when it went to hear Italian opera, would not be able to understand what it heard. All this is a sort of light skirmishing which is very readable, and might be taken hopefully to be intended to put the reader in a good humour for more solid matter to come. But the next chapter is evidently a parenthesis. It is called “The History of Her Majesty's Theatre,” and is confined to less than three pages. Information is given about the said theatre's being called “The King's” at one time and “The Queen's” at another; and we are told the name of the architect from whose designs it was rebuilt in 1790, after one experience of burning down. There are also remarks about Handel being a practical man of business, and about his organization of Italian opera; but the whole thing does not seem to be much to the point. The next chapter is about Covent Garden Theatre; but firstly and at some length about Mr. Frederick Gye, and the London Genuine Tea Company, and the handsome saloon they had and who went there; and how Mr. Gye came to be associated with the Italian Opera. This appears to be mostly parenthesis also; and even when it comes to mentioning the names of singers and of works performed, and how they were puffed, and so on, the best that can be said is that such information might be serviceable in a big work of reference on the London stage.

The next chapter looks as if it would go nearer the mark; for it deals with subjects for opera, and explains a little how Wagner prefers legendary and mythical subjects because their types are of most universal significance; and shows how composers who aim high have been attracted by such legends as Faust, Der Freischütz, Robert the Devil, the Wandering Jew, and the Flying Dutchman. There is also a long digression giving Goethe's views of a possible dramatic development of the legend of the Wandering Jew; but the main object of the chapter is to lead up to a full consideration of the Don Juan and the Faust legends. To the former, a third of the entire first volume is devoted; accounts of various forms of the story and its spread from one nation to another are vivaciously told, with more light skirmishing into stories such as that of the young man who married Venus's statue by mistake, and that of St. Nicholas and the King of Africa's treasure. The accounts of the first Spanish play by Tirso de Molina, and of Torelli's burlesque of Gilbert's *Convitato di Pietra* are very amusing, though they may be a little irregular; the same may be said of the consideration given to Molière's *Don Juan, ou le Festin de Pierre*, and the criticisms upon Sir Aston Cokain's wretched *Tragedy of Ovid*. It is left singularly enough to Hoffmann to deal with Mozart's *Don Juan*, and the chapter which treats of that central matter is a free translation of a part of one of the “Fantasiestücke,” which is poetical and fanciful, but cannot be taken to represent the views of the writer of *The Lyrical Drama*, or to be very closely to the point. The next chapter consists of fifteen lines by the author, and a quotation of several pages from Alfred de Musset's *Namouna*, and the end of the whole matter is a chapter on some of the Russian Poushkin's compositions in dialogue, founded severally on the fable of Salieri's having poisoned Mozart, and studies of Faust's possible condition after the death of Margaret, and fresh views of Don Juan; but as Salieri gets most attention it is as parenthetical as ever. The story of Faust is wrapped about with infinity of interest, and a certain amount of advantage is taken of the fact in the chapters which follow. It is true that such things have little immediate bearing on the Lyrical Drama, but still the matter is very amusing. An instance of this is the notice of the John Faust who was Professor of Magic at Cracow, whom also Melanchthon knew and described as “turpissima bestia et cloaca multorum diabolorum.” Yet more amusing is the story of the Polish Faust called Twardowski, of whom it is told that he sold his soul to the devil, and acquired the right to make three demands of him, and that, after having had his fling and made two of his demands, his third was that the devil should marry Mme. Twardowski; whereupon the devil, being sufficiently acquainted with Mme. Twardowski, preferred to retire from the compact, and let Twardowski go to heaven his own way. Readers of Thackeray's *Paris Sketch-Book* will remember in this connexion the story of Simon Gaubouge. Of such out-of-the-way stories and amusing trifles there is plenty, and it certainly has a tendency to reconcile one to the fact that, as far as concerns the Lyrical Drama, the book is more and more hopeless. Gounod's *Faust* comes in for a little notice, and the chapter ends with a dissertation on the versions of the part of Marguerite given by Mmes. Nilsson and Lucca. From this point a leap is made at an impossible angle into *The Flying Dutchman*. It is at least gratifying that large consideration should be given to that very admirable *Lyrical Drama*, which, like many really enjoyable works, is far too rarely performed in this country. The appreciation shown for the dramatic and poetic elements is also most welcome, and may

* *The Lyrical Drama: Essays on Subjects, Composers, and Executants of Modern Opera.* By H. Sutherland Edwards. 2 vols. London: Allen & Co.

perhaps counterbalance the rather superfluously long quotation from an "impressive version" of the story in a number of *Blackwood's Magazine* of 1821, which occupies half the entire chapter. *Tannhäuser* comes next under consideration; and in respect of this again the writer shows great appreciation of dramatic effect, and commits himself to the criticism that in this work "Herr Wagner's poverty as an inventor of melodies is shown very conspicuously," which is perhaps more a matter of individual feeling than of ascertained certainty. Precisely the same remarks apply to the dissertation on *Lohengrin* which follows. Elsa and Lohengrin are said to be "the two most poetical figures of the modern stage," which is gratifyingly appreciative, and objection is made to the utterances of Telramund and Ortruda, which from the musical dramatic point of view may be doubtful.

From this point the writer goes backwards, like Hamlet's crab, and takes up *Robert the Devil* and certain others of Meyerbeer's operas, which are described and appreciated, with incidental information about the singers who have appeared in them, and the source of the plots, and so forth, which is not highly important, and should certainly have come before Wagner in any consistent and orderly work. The same process is gone through with Verdi, and with Rossini and some of his works, and so on through notices of works of Donizetti, Bellini, Thomas, Bizet, and Flotow; containing a good deal of information which is of no great importance, and giving rise at last to wonder as to what has become of such works as Gluck's *Orphée et Eurydice*, and *Alceste*, and others, of Cimarosa's *Matrimonio Segreto*, of Cherubini's *Medea* and *Deux Journées*, of Auber's *Masaniello*, not to speak of *Fidélité*, or *Oberon*, or of *The Meistersinger*, or even of *Mefistofele*, and the last crux of the pseudo-purists, *Tristan and Isolde*. In fact, from this point the matter of Lyrical Drama appears to be almost given up as hopeless. There is a sort of burlesque account of some experiences of impresarios, a chapter devoted mainly to the question whether Mr. Washburne, late Secretary of the American Legation in Paris, was justified in using his advantageous position to advertise for a "first class, bareback, male and female rider" for the "Great American Circus, Paris," &c. And in this manner the subjects of the chapters go darting about in perfectly irresponsible freedom, with occasional returns somewhere in the direction of the drama—*as*, for instance, in a chapter on theatrical anomalies and amusing stage accidents and incidents. In another chapter the author takes upon himself to chastise justly the errors and absurdities of Ouida and of the author of *Music and Morals*, together with other writers of more dignity and less presumption. Dictionaries of music follow, under which head the question is discussed as to whether Rousseau did really write *Le Devin du Village*, while a tribute is paid to the literary qualities of the famous *Encyclopédie*. Mr. Grove's Dictionary comes in for special and favourable consideration; and there follows something about classical chamber music, for which the author does not appear really to have much appreciation, and a little again about the reasonableness of opera.

The last two chapters go as clear away from the subject as can be. One is an amusing account of the author's visit to Tatra Füred, a little Hungarian watering-place at the foot of the Carpathians, at the end of which a few words are said about his having heard some Hungarian players trying to learn parts of *Il Trovatore* by ear; and the last of all gives some chatty accounts of absurd examples of misprints, translator's mistakes, ingenuities of intentional plagiarism, and such trifles.

Taking it all round this is one of the most bewildering books a man could wish to come across. Seeing a title which promises "volumes," and having no preface to explain its reason for existence, the hopeful reader plunges into a labyrinth of mostly disconnected and even unassimilable chapters; and these are not merely disconnected one with another, but go wandering about in themselves, touching airily and lightly on all sorts of out-of-the-way and sometimes quite superfluous information; while, worst of all, the author does not anywhere attempt to deal with the most interesting questions which the name of the book suggests. On the other hand, the volumes must be confessed to be full of amusing and brightly told anecdotes, and a great deal of genial appreciativeness, which is, however, rather of poetry and drama than of what is really valuable and highly enjoyable in music; and if this can save people from the feeling that they have been a little bit hoaxed by the title, it is somewhat of an achievement. A genial Irishman once said that he had written a letter which was all parenthesis. To achieve two volumes on the same principle would, indeed, be a triumph of art; and the present collection of items may come as near to this as a man may hope for. Otherwise it might have been better to call the collection "Chapters in Zigzag," and to add a little preface to explain where they came from.

HOW I CROSSED AFRICA.*

MAJOR SERPA PINTO'S account of Africa is equally interesting to the geographer, the ethnologist, and the general reader who likes plenty of adventure. It is, we confess, the adventures and the ethnology of *How I Crossed Africa*, rather than the exploration of the affluents of the Zambesi, which have interested ourselves. Major Serpa Pinto, a Portu-

guese cavalry officer, whom the singular attraction of Africa mastered and led from Loanda to the Zambesi, and so due south to the Transvaal, is a writer and adventurer of the fearless old sort. His book, as he modestly observes, makes no great literary pretensions. The author has extracted what he deemed most valuable from his notebooks and diaries. He has not encumbered his book with so much unnecessary detail as many African travellers have offered to the public. When a man's only friend (except a pet goat, which one day devoured a fetiche) is his diary, he is apt to confide rather copiously in that companion. And, when it comes to publishing, he naturally dislikes the task of abridging his own composition. But Major Serpa Pinto is not very tedious. He has lost out a great deal. He occupies too much space with perpetual accounts of the difficulty of obtaining carriers. His troubles with his carriers absorb him, as the whole intellect of some ladies is swallowed up with their difficulties with their servants. But Major Serpa Pinto's character is delineated by himself with much unconscious humour. He is brave, loyal, persevering, hot-tempered, and he knows it. He does not "pretend to have rigorously followed the precepts laid down in the twentieth chapter of the sublime Book of Exodus, certainly the most beautiful of the Pentateuch, but he did his best not to depart too widely from them." He felt that European manners and ideas are not always in place in Central Africa, and he acted on a rough-and-ready sense of natural justice.

Sometimes the Major took the law into his own hands with admirable effect. Africa is the asylum of cosmopolitan scoundrels, men escaped from Portuguese prisons, and other adventurers who strive to out-do even the natives in moral callousness. One of these blackguards proposed to Major Pinto to use his arms and ammunition "in a most villainous undertaking," probably slave-catching. The Major at once had his rascally countryman seized and tied up to a tree, where he caused him to receive fifty lashes. As the man had threatened to stir up disaffection among the carriers, this summary justice deprived him of any prestige he might have enjoyed among the blacks. On another occasion, a slave merchant brought his merchandise into the Major's camp, and so irritated that friend of freedom that, says he, "I made a dash at the fellow, seized him by the throat, and drew my knife, with the intention of plunging it into his body." But better thoughts prevailed. When Major Pinto had actually aimed his revolver at the head of another malefactor, some one threw up his hand, and the bullet, fortunately for all concerned, sped harmless. This is not the sort of major for African kings to meddle with. Being bullied and "boycotted" in the Baroze country, Major Pinto sketched out a very pleasing plan of a revolution, a scheme so picturesque that the reader almost regrets it was not executed:—

I had resolved, if Lobossi decided upon my death, to surround myself with five of my most reliable men, to act as bull-dogs, such as Augusto, Camutombo, and others, and repair with them at once to the King's audience, where all are alike unarmed; to cause them, at a given signal, to spring upon Lobossi, Gambella, Matagja and the other two privy counsellors, whilst I, accompanied by Machauna, the General in Chief, who had ten thousand warriors at his call, would shout out, "Live Monatumuono, King of the Lui; long live the son of Chipopa!"

Less conscientious and less official explorers than Major Serpa Pinto might probably perform great feats of filibustering in the interior of Africa. Thirty resolute and well-armed Europeans might seize the "stool" of a native prince, govern his kingdom, extend their dominions, and alter the history of a continent. So, at least, some passages in this book lead us to imagine; but the practical difficulties may be greater than they seem.

Major Serpa Pinto had much ill luck on his journey. At the start he was provided by the Portuguese Government with arms, equipments, stores, provisions, that Mungo Park never dreamed of in the old days when lonely white men wandered from tribe to tribe, with no currency except the brass buttons of their coats. Major Pinto also had companions, Capello and Ivons, but they deserted him and went their own ways. Though he appears to have behaved to them with generosity, their conduct naturally caused him much distress and trouble. But illness, the want of carriers, the dishonesty of the natives, and the extortions of *Sovas*, or kings, caused the chief difficulties in his arduous march. In the populous Bihé country he found a singular race of born adventurers and discoverers, who travel for years at a time for their own pleasure and interest. The wealthy traders among the Bihenos would be considered "warm men" even in countries less sultry than Africa. "If they only had the power of telling where they had been, and describing what they had seen, the geographers of Europe would not have cause to leave blank great part of the map of South Central Africa." Though possessed of "great pluck" (tempered, apparently, by almost invincible discretion in certain circumstances), the Bihenos are profoundly vicious, openly depraved, persistently cruel, and cunningly hypocritical. These qualities remarked in them are common, Major Pinto thinks, to almost all the Africans with whom he made acquaintance. As fever and rheumatism (only temporarily cured by a sudden ducking in a river) detained Major Pinto for many months in the Bihé country, he was able to make an interesting study of their religion, customs, and political institutions. As far as religion is concerned, we do not think Major Pinto a very valuable witness. He is apt to say "Religion they have none." Thus of the Gonzellos he observes, "though thorough believers in sorcery, they never give a thought to the existence of a Supreme Being." Again, the Bihenos "have no idea of any religious faith, they adore neither sun nor moon

* *How I Crossed Africa*. By Major Serpa Pinto. Translated from the Author's MS. by Alfred Elwes. London: Sampson Low & Co. 1881.

they set up no idols, but live on, quite satisfied with their sorceries and divinations." Now it is very likely that both Gonzellos and Bihenos give no thought to a Supreme Being. But it does not follow that they have no religion. Among races in their state of thought, supremacy is "in commission." They have no idea of a Supreme Being, but they have the small change of the iden, and scatter the attributes of creative and other powers, of rewarding and punishing and the rest, among a number of fanciful beings. Thus the Bihenos, according to Major Pinto, believe in the immortality of the soul, or something very like it, and in a kind of purgatory. The Gonzellos, in the Caquingue country, like the Australian and American tribes, have not yet reconciled themselves to the belief that man is necessarily and naturally mortal. "None of these peoples admit the existence of natural causes of diseases or death. If any among them should fall ill or die, the cause is attributed either to the souls of the other world (one among the spirits being specially designated) or to some living person who has compassed the death by sorcery or witchcraft." Just as among the Australians, a kind of magical coroner's inquest is held after a natural death to discover by omens and divination the ghost or wizard who caused the lamented decease. This widely-spread amazement at the ordinance of death as a thing unnatural and abnormal has produced all over the globe myths of the origin of death. But these topics did not greatly interest Major Pinto, who, however, discusses at length the functions of diviners, sorcerers, medicine-men, and rain-makers. He was, as usually happens in Africa, taken for a rain-maker, because his visit to a village coincided with a shower. He tried to convince the chief that he was not responsible for the weather, and one of his companions delivered a lecture on meteorology, adapted to simple minds. But, the rain ceasing, the chief went among his retinue, and threatened to take the life of the mischievous fellow who had closed the windows of the heavens.

The government of the Bihés is somewhat quaintly described as "an absolute monarchy with a good deal of feudalism about it." This means, not that the feudatories are semi-independent, and a match, or more than a match, for their sovereign, but only that their power is tolerably strong among their own dependents, whom they lead to join the armies of the Sova, or head-chief. On the death of a Sova, there is an interregnum, a period of plunder in which strangers are apt to be seized as slaves. The under chiefs now select the rightful heir, two parties go out and "pot" a man and an antelope, their heads are put into a basket, the medicine-man conjures with them, and the new Sova is installed. The curse of the country is the custom of *mucano*, by which traders and travellers are subjected to enormous fines, often for trivial offences against some unintelligible etiquette. With all their vices and crimes, the Bihés have energy, and Major Pinto has a much higher opinion of their future than of that of the lazy tribes who do nothing but sleep and eat. He stayed in the Bihé country long enough to consume one hundred and sixty-nine fowls—a monotonous diet. His drawings of the instruments, axes, knives, pipes, hoes, arrows, and so forth, made by all the African tribes who are workers in iron, are well executed and full of interest. The forms are often exactly like those of very early bronze implements, represented in such works as Mr. Evans's *Ancient Bronze*.

With his Biheno carriers, who are not averse to cannibalism (preferring to eat potters and basket-makers), Major Pinto slowly worked his way to the Zambesi. He found cloth the best form of money. The demand for beads is very precarious. Black beads are the only currency in one district. Red beads with white spots pass in another. Old metal cartridges are firm, if not lively, but striped cloths were often flat, and blue shirtings were uncommonly dull. The sort of tricks played with blue lights and gases by lectures on chemical science do not strike terror nor inspire respect. The negroes set them down to sorcery, and, as the Scotch gentleman, on hearing a marvellous story, observed that he "was a leser himself," so the natives are themselves sorcerers, and are not much impressed by European magic. In the Mucassequees Major Pinto found the regular thoroughgoing savages of South tropical Africa. They do not dwell in villages. "They are born under the shadow of a forest-tree, and so they are content to die." They do not cultivate the ground, but live on roots, honey, and game. They are "whites of the type of the Hottentot race, in all its hideousness." But some of the more cultivated Ambuella girls are pretty. This people practises a well-known form of savage hospitality. The King's two daughters, Opuda and Capéu, beset Major Pinto exactly as the Soldan's daughter, in old French romances, always besieges the heart of the Christian Knight. But Major Pinto, unlike the heroes of romance, was an exploring Galahad. One of these young women "inspired me with more fear than the wildest of wild cats could occasion."

Oddly enough, the *spretæ injuria forma* was neither permanent nor maleficent. The two girls dropped into Platonic relations with the Major; "we lived on, the best friends in the world"; indeed, these good girls were the only native friends the Major made. On reaching the Baroze country he was "boycotted," as we have said, was deserted by his carriers, and was robbed of his weapons and ammunition. Fortunately he had still "the King's rifle," a present from his sovereign, and the weights of his net supplied him with lead for bullets. With these to provide food, in a country not deficient in game, and with a stout heart, he worked his way to the Transvaal. Fortunately he found in the very centre of Africa, and in the very worst of his difficulties, a

French missionary, M. Coillard, "the best and kindest man he ever came across," and other European explorers. At length he reached Pretoria, the English, comfort, and the "pound sterling." His opinion of the courage of the Boers, maligned by missionaries, has been confirmed by recent events. But we must always set against his view of their dealings with the natives the view and the experience of Livingstone. The last of the many victims of the expedition died, and was buried near a missionary settlement in the Transvaal. The remnant of the expedition numbered but eight persons, when Major Pinto, "completely dazzled" by the splendour of the entertainment, dined with the Treasurer of the Transvaal.

FOUR CROTCHETS TO A BAR.*

THERE is a certain cleverness in this story, but we greatly doubt whether it is enough to make up for the vein of low farce which runs through it. Almost all the characters are very vulgar, and at times very dull; there are far too many of them, and the scene gets overcrowded; yet we must admit that the liveliness of certain passages, and the novelty of the plot may prove the saving of the story, and win it the popularity of a month or so in the circulating libraries. With all its faults—and they are as great as they are numerous—it is not nearly so bad or so poor a novel as many that keep the attendants in a bustle at Mudie's for fully as long a time as a comet remains in sight. Such a story as this it is by no means easy to analyse. It so abounds in characters that we scarcely know with whom to begin. Among the four Miss Crotchets who give the somewhat foolish name to the book most certainly the heroine cannot be found, for they have all, when the story opens, not only reached what is called "a certain age," but even got beyond it. The only safe course in writing about such a hodge-podge as this story is to stick closely to the fortunes of the leading lovers, and not to leave them till we are safely landed at a wedding-morning and the parish church. The tale opens, then, at a seaside place called Shellford-by-Shore. There the Miss Crotchets lived, and there they were presently joined by a rich brother from Jamaica, with his son John and his daughter Augusta. This young lady had a flower-like head, we are told, laughing eyes, and golden-brown hair. She was her father's darling, and was clearly meant to become the hero's darling also, whenever he should appear. The society at Shellford seemed at first sight unpromising enough. In truth we doubt whether a meaner and a more vulgar set has ever been found in one small place. The author certainly shows a wonderful exuberance in vulgarity. The Miss Crotchets—or, at all events, most of them—were vulgar, and so was their wealthy brother, and so also were the vicar and the vicar's wife, the Squire and the Squire's daughter, the doctor and the doctor's assistant, and in fact almost every one whom we can call to mind. There was one bright exception to this in a young physician, Dr. Lansdowne, who had lately settled at Shellford, and about whom the gossips were busy. He was a widower—at least he said that he was—but suspicious had been roused that his wife was still living, and every one was ready to believe the worst about him. He falls in love with the heroine, and she is not slow in returning the compliment. He does not at first propose to her, but asks her to give him a promise of her friendship. To this she sees no objection, and they shake hands on it. "I will be your friend," she said. "He understood her, knowing that she believed herself to be giving him a pledge of such friendship as annihilated all differences of condition and all prejudices of age." Why did they not at once go further, and get engaged? The answer is that, in the first place, they were only in the first volume, and in the next place there was clearly some mystery or other about the fascinating young physician which needed clearing up. He indulged in soliloquies which, though natural enough in a young lover who openly declares himself, are suspicious in a widower who merely asks for a girl's friendship. Early in the story we find him thinking about Augusta Crotchet's bright face, and then asking himself why he thought about it, when she was nothing to him and was never likely to be anything? Thereupon he turns round upon himself, and with many notes of admiration exclaims, "Never likely! when youth and life seemed all to abound for him! when the things of which he never spoke and never heard now were becoming almost as if they had never been! Never likely!" Then the author tells us how he hereupon whipped up his horse, and drove rapidly on, but how neither exercise nor fresh air could rid him of those fresh memories which, once awakened, clung like stinging insects. Hereupon the reader, if he at all resembles ourselves in this matter, straightway turns to the end of the third volume to see whether Miss Augusta Crotchet does in the end become Mrs. Lansdowne, or whether she dies broken-hearted and he lives penitent. There was just a chance, moreover, that the doctor was not the hero after all, but that the right man turned up later on. The inexperienced reader may take our word for it that he will be saved a great deal of time and labour if he will always ascertain with all promptitude who is the hero and who is the heroine. In nine cases out of ten this question is answered by the marriage that takes place in the last chapter. Knowing this fact early in the story, he is able to skip over all

* *Four Crotchets to a Bar*. A Novel. By the Author of "The Gwilliams." 3 vols. London: Smith, Elder, & Co. 1882.

the descriptions of every one but the happy young couple. An author, indeed, often throws out, as it were, a false trail, along which his reader follows him only to discover at last that he might just as well have parted company with him when he started on it, and have taken up the scent further on. What was the discovery that we made in the present case we are rather inclined to keep to ourselves, for we do not forget that many readers take a pleasure in tormenting themselves by gratifying only through regular and steady reading that strong curiosity which they feel to know the end of a tale.

Matters certainly soon begin to have a very black look for the young doctor. He has plenty of enemies, and they presently get on the trace first of his father-in-law, and next of the daughter of his father-in-law. It is presently discovered that she is shut up in a private madhouse. Her name was Janet, and she maintained that she was Janet Lansdowne, the physician's wife. His little boy Algernon adds to the belief of the gossips of Shellford and to the bewilderment of the reader and the heroine. One day he was playing with the vicar's son at digging a grave, by means of which he proposed to descend to the lower regions. He suddenly stopped in his work and began thus to question his playmate:—

"Does your papa put people down there when they die?"

"Yes," answered Humphrey, "so it can't be far, but I don't think we shall get there to-night."

"Then it must be quite easy to get back?"

"That isn't, I say. Where's your mamma? Did my papa put her down there?"

"No. He didn't. Say that again, and I'll fight you. She went up the other way. She went one night when we were all in bed. I'll tell you a secret. My papa cried. I didn't, because I guessed she'd come back again."

"Ah! that's miles and miles farther," said the parson's son. "It must be twice as hard to get up there."

"They can come down easier, though," said Algernon.

"That they can't."

"They can then, for I've seen them."

"It is not true. You never saw any one that did it," said Humphrey, pausing in his work.

"It is true," said Algernon Lansdowne solemnly. "I did not see them coming down, but I did see them after they had come, only it's a secret and I must not tell it you."

At last he tells his friend that he had one night seen his mother, that she was all in white, and had been crying, and that his father took her away again. The heroine being a very admirable young lady hereupon gives the hero up, and the reader is almost inclined to follow her, for he sees no way of escape out of the difficulty. Our fashionable novels have done a good deal in leading us to form very lenient judgments of men and things, but they have scarcely reconciled us as yet to bigamy. Our education, however, is going on very steadily, and no doubt in a few more years all our old prejudices will have disappeared. Nevertheless, for the present one wife in the madhouse and another at home are more than we can allow even in the case of the most admirable and virtuous of heroes. Happily our author does not make this hard trial of our old-fashioned morality. The first glimpse of light in the maze into which we had been led reaches us when we learn that Mrs. Lansdowne had had a twin sister. A blessing on twins, we say, and on the wonderful likeness that always exists between them. They have served both author and reader many a good turn already, and will doubtless serve them many a good turn yet. It is at first only a glimpse of light that falls, but it slowly broadens till hope returns. Whether, however, the heroine recovers from the melancholy into which she had fallen, whether the paleness of her cheeks is chased away by colour, and a returning appetite gives as much plumpness to her body as a heroine can venture to have; whether, moreover, the young doctor was really a widower; whether he returns from the solitude to which he had betaken himself; whether he himself turns mad or gets married a second time, that we will never divulge. There are circulating libraries, and by sending to them the inquisitive reader can find out all this for himself. Our knowledge has been only acquired by the expenditure of a good deal of trouble and patience; and though it has certainly cost us far more than it is worth, yet that is no reason why we should make it common to those who are indolent, who moreover, likely enough, would like much better to have the mystery left for themselves to unravel.

Such a plot as this, with the use of a good many fine words, ought to be able to fill up three volumes very easily. In the power of using such words the author certainly is not wanting, though it is not exercised so frequently as is commonly the case. In the last lines of the first volume we have an amusing instance of that style which is so highly esteemed at the present day, in which there is a jumble of fine words and of terms that at best are half slang. The heroine was thinking over the promise that she had made to the hero that they would be friends. "Only friends," and yet her heart went singing for the richness of the boom which her words discounted thus; and over all the melancholy land the sounds of trouble melted in her ears into songs of joyfulness and mirth." The land, by the way, was not melancholy so far as we could discover. At all events, the sun had been shining a short time before, and the heroine had been getting into the shade to escape its rays. But, melancholy or not, what has such a word as "discounted" to do in such strange company? If it cannot be spared, why then, in that case, the mercantile image should be kept up, and we should be told "that the sounds of trouble melted in her ears into premiums of joyfulness and scrips of mirth that rose above par." However, it is not the fine

words to which the author chiefly trusts to swell out the three volumes. The supply of low characters is almost inexhaustible, and whenever the hero or the heroine are off the scene, there is always a piece of broad farce ready to fill up the gap. In this kind of low buffoonery, perhaps, the chief merit of the story is to be found. There is, however, far too much of it, and the end is reached with a feeling of thankfulness. Nevertheless, as we closed the book, we were ready to allow that, when judged by the common standard of the novels of the day, it cannot be fairly pronounced either hopelessly bad or utterly stupid.

STUDIES OF MODERN MIND AND CHARACTER.*

THIS volume displays a considerable amount of reading, but, unfortunately, almost no power at all either of digesting what has been read or of reproducing it for the benefit of others. The style is dull and heavy; the narrative portions of the book leave on the reader's mind the impression that something, he does not quite know what, has happened; and the reflections and observations will appear to most persons to be, for the best part, either very old or quite unsound. However, the book abounds in quotations so numerous and of such length that a good deal of information may be gleaned from it by passing over what comes from the pen of the writer, and attending only to that which is due to his authorities. It is to be regretted that a writer evidently industrious and painstaking should not have spent more of his pains and industry on the arts of composition. In a great historical or philosophical work, heaviness and dullness—drawbacks as they are—may be put up with for the sake of matter or thoughts not to be found elsewhere. But the whole worth of essays such as those that this volume consists of lies in their readableness, in their putting in a clear and popular form what the writer has gathered from books too numerous or too little accessible for the reading of the general public. They can then serve to give some information to those who cannot go to the fountain-heads, and to act as guides or as stimulants to those who can. But essays like these, to read which with any degree of attention requires a strong and constant effort of the will, serve neither of these purposes, and only have the effect of giving an association of dullness to the subjects, however brilliant and attractive, of which they treat. One can hardly, for instance, read through the essay on Voltaire, which shows much careful labour on the part of the writer, without longing for a volume of his letters or novels to clear one's mind from the fog with which the essayist has beclouded it.

The book before us treats of many subjects. There is an essay on Guicciardini, one on Giordano Bruno and Galileo, one on Swift, another on Junius, five or six on France, from the days of the old *régime* to the Franco-German war, and, finally, one on Bismarck and what the writer calls "Pan-Teutonicism." For the most part they are reprints of contributions to the *Quarterly Review*; and this fact will suffice to prepare the reader's mind for writing not of the liveliest sort. The last essay of all, which treats of Modern Germany, is perhaps the weakest of the whole series. It appeared in January 1871, and not even the astonishing events of that winter and the preceding autumn can rouse the writer to any animation of feeling or style. Some of the most important contributions to the literature of "Pan-Teutonicism," particularly the *Was fordern wir von Frankreich?* by Professor Heinrich von Treitschke, the leading German Chauvinist, are not mentioned or quoted at all. No better source of information as to the growth of this feeling could be found than in the writings of Herr von Treitschke, published between the beginning of the Danish complication and the close of the Franco-German war; yet they are passed over in silence. Some of the statements made on matters of public notoriety show an extraordinary want of knowledge as to German feeling and recent German history. "Nothing," says the writer, "could seem less substantial in matter-of-fact foundation than the Schleswig-Holstein enthusiasm of six or seven years back in Germany." Now it is certain that German enthusiasm on this subject in 1863-4 was only a re-awakening, under conditions more favourable for its fulfilment, of German enthusiasm in 1848 and the following two or three years. The frustration of German hopes at this earlier period and the so-called *Schmach von Olmütz*, or humiliation which Prussia suffered about the same time at the hands of Austria, were the two chief grievances which kept rankling in the minds of the German people. The feeling of Germans on such matters was repeatedly derided by Heine, who never lost an opportunity of turning the unfulfilled hopes of his countrymen into ridicule, and who shared the common prejudice that Germans were by nature a people of dreamers and not doers. It is true that Prussia ended by getting from Denmark more than Germany asked for or had either a legal or moral right to; but it is equally true that in entering on the campaign against Denmark Prince Bismarck had about as substantial a foundation in German feeling as a statesman could desire. It was otherwise in the case of the war with Austria in 1866, which was generally unpopular in Prussia till the brief and victorious campaign in Bohemia revealed to the Prussian people its own strength and the unsubstantiality of the illusions which had long made it an obsequious follower of Austria.

* *Studies of Modern Mind and Character.* By John Wilson. London: Longmans, Green, & Co. 1881.

"Pan-Teutonism"—or the absorption by Germany of all nations of Teutonic extraction—is here treated as if it were a serious power in international politics. It does not seem to have occurred to the writer that, after the unexampled victories won by Germany, some extravagant displays of national pride were only natural. It is a wonder that they have been so few in number, and have been confined to a few professors or journalists. The responsible actors in German politics have disclaimed them from the beginning, and no step in the direction of "Pan-Teutonism" has been taken by the German Government from that day to this. The German people, though circumstances have made them the leading military Power of the world, are peaceable and ill disposed to adventures; and the German Government has shown that it knows better than most the difference between phantoms and solid political objects. It is well known that in annexing Alsace and Lorraine military objects were those which the German Government had mainly in view, although it was naturally not insensible to the advantage of satisfying national pride and making amends for what was held to be an old-standing national wrong. It was unity and not empire that Germany was striving after. And to talk as if the revival of the "Holy Roman Empire" could be a serious object of German statesmanship or a serious desire of any part of the German people is to betray a complete misconception of the whole drift of recent German politics and of the whole character of the German people.

As an instance of the manner in which the author contrives in his comments to extract all the nerve out of the quotations which he makes from others, we may take a casual remark of his on a saying of Napoleon I., "*En dernière analyse, on ne gouverne qu'avec des éperons et des bottes.*" "This," says our author, "was undoubtedly true at the epoch at which he undertook to govern." But it is undoubtedly true everywhere and at all epochs. *En dernière analyse*, the power of the sword is what every Government on earth rests on—republics, monarchies, and despotisms alike. This is a universal truth, put epigrammatically by Napoleon. In the last resort force is the arbiter, and this in the most law-abiding as in the most lawless times and countries. To qualify a universal truth of this sort is as though one were to say, "It has been asserted that oxygen is absolutely necessary for human life. And this is undoubtedly true in large cities." How soon we come to the last resort is another matter, and this varies indefinitely at different periods, among different races, and under different forms of government. A similar slovenliness of thought is shown by assertions such as these:—"Napoleon III. made two great Ministers, but he made them for other nations—Count Cavour and Count Bismarck." Napoleon made neither, except in the sense in which a rock makes the tunnel that goes through it. He and his policy were just factors in the political problems which Cavour and Bismarck had to deal with; but he taught these statesmen nothing, except the fact that he was himself an irresolute dreamer of dreams. In breadth, in clearness and in accuracy of vision, in diplomatic adroitness, in vigour and decision of purpose and action, and in sympathy with the great political forces of the day, and power of turning them to the benefit of his country, each of the two statesmen whom Napoleon is here preposterously said to have "made" was immeasurably his superior. In no sense whatever can Napoleon be said to have "made" either of them—not even in the limited sense in which Victor Emanuel and the Emperor William did. Nor, again, is it true, as the author asserts in the same essay, that "Louis Napoleon's policy, tortuous or direct, never had but one object—the aggrandizement of France as a condition to the permanence of the Napoleonic dynasty." That this was a main object of his policy is true enough; but that it was his "one object" is inaccurate. His sympathy, for instance, with the cause of Italy was genuine, and dated back to the time when he was himself a conspirator against the oppressors of the country from which his own family was derived. He was, in fact, more disinterested than the French nation. And again, there is every reason to suppose that he was sincerely anxious for the welfare and progress of the people he ruled over. Vacillating, dreaming, open to light and to impulses from many sides, he was the very reverse of those men of one object among whom the author of these essays numbers him. Cavour—a greater but in some respects a narrower nature—was a man of one object, and his repeated victories over Napoleon in the momentous year which followed the Peace of Villafranca were chiefly due to the fact that he had one aim while the Emperor had several. To make Italy strong, but not too strong; to gratify the lust of territory of his own people; to keep on good terms with the Catholic Church; to befriend the Italian patriots, who desired nothing so much as the ruin of the temporal power; to found, if possible, a central Italian Napoleonic kingdom; to save Piedmont from being crushed by Austria; at the same time not to go to war a second time with Austria—these and other conflicting aims were what this man of "one object" tried to reconcile; and it is not surprising that he was overcome by a statesman who knew just what he wanted and just what was feasible.

We have referred to one or two only of the multifarious subjects treated in this volume. We regret that we are unable to say more in praise of a book on which the author has evidently spent pains. But, until it is recast and re-written in quite a different spirit and style, we cannot honestly say that it is either interesting or helpful.

TO-DAY IN AMERICA.*

THESE volumes have surely been labelled with the wrong title. On looking through the table of contents one thinks that "Leaves from a Scrap Book" would be more appropriate. On turning over the pages we think that "What Everybody says about Everything" or the "Cream of the Commonplace" was the title really proposed by the author. On actually reading the book we perceive that the most appropriate title, which was probably overlooked by the author, would be "The New Boiling of Old Rags" or "Topics already Done to Death." The book is not apparently presented as a book of travel, because the author does not in his descriptive pages show that he has seen any part of the continent outside New York and Quebec, and to have seen these towns alone hardly justifies a man in writing about so large a country as America. There was once a traveller who came all the way from New Zealand to see London. He landed at Poplar, where he stayed till it was time to take ship back again, which he did, under the firm belief that he had seen London in all its grandeur. But he did not write a book about it. Then, again, the work is not written in order to illustrate unknown phases of American life, because there is little or nothing in it about American life, except perhaps a description of a New York opium den and a trotting race. Mr. Hatton, in fact, tells us nothing at all about the States which the world does not already know. There are, to be sure, many disquisitions on things belonging to this country as much as to America. We need not, for instance, go to America in order to learn what is meant by the Ulster Custom; nor is it necessary to cross the ocean in order to attend a Spiritualist's *séance* and listen to rappings, because the same thing, quite as good, may be had in London. And if any one wants to reproduce the blasphemous mouthings of a coarse and vulgar atheist, we can supply him with an article of native manufacture, warranted quite as offensive and quite as unseemly. And as yet, we believe, the actual words of the British atheist have not been reported by any respectable American publishers; so that, so far, Mr. Hatton's publishers are ahead of rivals on the other side; nor has the British atheist spouter ever received from any American, so far as we know, the admiration and appreciation which Mr. Hatton bestows upon a certain Mr. Ingersoll. "There was," he says, after quoting a choice specimen of this gentleman's method, "a rough bludgeon-like logic in his analyses of the Gospels, and he showed, to the evident satisfaction of his hearers, where churchmen had tampered with them, and how they had overloaded the simple teaching of Christ with commandments and promises which He never gave." Remark that Mr. Hatton does not say "attempted to show," or "pretended to show," or "professed to show." No; Mr. Ingersoll "showed"—*demonstravit*—these remarkable facts, about which, therefore, there can be henceforth no doubt. The Company of Revisers have been found out in their tamperings and their addings; it remains only for the original Gospels to be published, stripped by Mr. Ingersoll of the additions and the tamperings, for the instruction and benefit of the human race. Setting aside any questions of taste, reverence, and good feeling, is it possible to conceive of a great subject being treated in a spirit more uncritical?

It is, indeed, in an uncritical frame of mind which would be surprising in a schoolgirl that the whole book has been put together. Mr. Hatton goes to a *séance*, receives the *spirit* messages from various members of his family, and a single word from a great English writer. That word is "spooks," and spooks is American slang for ghost. This stale rubbish is treated by Mr. Hatton as evidence worthy of calm and judicial consideration; he tells this threadbare story "as a patient inquirer" and a "candid observer." We know the "patient inquirer" and "candid observer" by this time; we have often heard him on Spiritualism, ghosts, supernatural events, premonitions, rappings, and all the rest of it; we are familiar with his calm and thoughtful air; we expect beforehand the story which he will tell; we know his summing-up, "I can only say that this is what I saw"; and our only disappointment in Mr. Hatton's story is that it has been told about the performances of every little practitioner in the Spiritualistic trade. Of course we are not at all surprised to be informed that there are a great many people in New York who believe in Spiritualism. One thing Mr. Hatton tells us for our comfort. It is that Mr. Ingersoll, the atheist orator (who is also, it appears, a colonel and an "eminent lawyer"), has not yet classed Spiritualism among the "degrading superstitions." There is some hope, therefore, that he believes in it; and we cannot but feel that, if so, it serves him right.

Again, when Mr. Hatton discourses on emigration, he goes, in the fine credulity of the uncritical spirit, straight to the really trustworthy quarters—namely, the papers issued by Emigration Agents—just as Martin Chuzzlewit did before buying his well-known little lot in Eden. The beautiful thing about these papers—whose figures, Mr. Hatton says, he has "taken some pains to verify"—is that they contain no vexatious and disappointing statements. "Never was not touched upon by the Eden agent, nor was the word 'rattle' so much as mentioned. So with Mr. Hatton's statistics. They are beautiful; they "average out" in a most surprising way; the decimals alone are irresistible. Until one comes to ask about the other side of the picture, one is tempted to believe as readily as Mr. Hatton

* To-day in America: Studies for the Old World and the New. By Joseph Hatton. 2 vols. London: Chapman & Hall (Limited). 1881.

himself that Paradise still exists, and is spread over the greater part of the United States. For there is not one word of warning; nothing is said of fierce summers and cold winters; of the locusts, caterpillars, Colorado beetles, lawless settlers, fights, Red Indians, mosquitoes, cyclones, tornadoes, the roughness and monotony of the life and its many hardships. In the same spirit he treats of Canada, her prospects and her probable absorption by the States. Already, he says, "cocktails have become a national institution." There is no arguing with a book which is a mere collection of parrot cries and the echo of ephemeral opinion, but we may remind those who talk of Canada being swallowed up and so forth, that Canada is a country with a great militia; that Canada would fight for independence, even if deserted by England; and that there is no party in the States which would go to war in such a cause. As for separation from the Mother-country, that is also a wider question than Mr. Hatton's instructions seem to suggest. It will come speedily, say these philosophers, chiefly because England's trade is on the decline. This statement, which we understand to mean that England's trade will speedily reach the vanishing point, is also fast becoming a parrot cry. It affords Mr. Hatton, however, in his book about America, an opportunity of discussing Protection in England, Free-trade, Commercial Depression, and Political Economy generally; this he does with the aid of one who is unshackled by any of the principles of learned professors. It is characteristic of the "common-sense" whom Mr. Hatton "marviewed" for these volumes to forget certain elements of human nature which are the croaking prophet to confusion. In other words, the good sense, the ability, which have made England what it is, may be supposed to remain with us still; the bad sense may be closed; certain branches of industry may be closed open to them; but even under these changed conditions the old spirit may be trusted to carry out the policy of the country in other ways. The opium-smoking, the blasphemies of Colonel Chesnut, the rapping, the stage, emigration, England's decline, these are only some of the topics touched upon in these volumes. They cannot exhaust the list; we may, however, point out that Mr. Hatton has got a good deal to say on the subject of copyright. He writes naturally from the author's point of view; he is apparently one of those old-fashioned believers in the right that every author is a wit, an ingenious person, a man of intellect. He seems also to be under the idea that it is a more noble thing to write ephemeral novels than to write for ephemeral papers. At all events, he says that "there is nothing more sacred in the history of intellect than the fact that the anonymous press of England has literally ground up, body and soul, some of the brightest and most capable men of the country." How does the anonymous press literally grind up the body of the writer? We suppose Mr. Hatton means that writing is hard work; but so is a practice at the bar; so is success of every kind; and to be really successful one must needs be strong. How, again, does the anonymous press literally grind up the soul of the writer? This fusian stuff will, very well for a circle of third-rate *littérateurs*, a class who have always been remarkable for estimating their mental powers at least above the market value, but in a serious work one expects to find it. No doubt many clever and able men are anonymous journalists; but so have many men neither clever nor able. To write fluently is a very small gift; and it is a great piece of presumption in the small writer to believe that his talent is more than that of the lawyer, the physicist, or the engineer. Journalism of a kind may be taken up by anybody who knows how to spell. And, forsooth, we are called upon to pity the journalist because he is anonymous. To begin with, there is very little of the anonymous about the work of good men in the profession; and as to the rest, why should they not be obscure? A general medical practitioner in a country town might just as well lament his obscurity. Yet he is known, and so is the journalist, among the people who employ him, which is all he should want. But, says Mr. Hatton, the wisest brains of the day are exhausted in press-work at the pay of first-class mechanics. A first-class mechanic is a rare person; he can command high wages; but we doubt whether any daily paper exists whose rate of pay is such as to justify this reckless assertion. Perhaps, however, Mr. Hatton wishes the world to believe that the wisest brains are found among the penny-a-liners. The plain fact is that a good writer soon gets found out and draws good pay; and there are always plenty of bad writers to compete among themselves for the bad pay.

It is a weary book, a book which should not have been written; its conclusions ring like the echoes of commonplace-talk; it tells us nothing new. We had intended speaking of the bad taste which is constantly displayed; but we content ourselves with asking one question—What is to be thought of a writer who, after expressing (in a book on America) his disapproval of the way in which men in London stare at ladies, emphasizes his views by a quotation from a novel written by himself?

MINOR NOTICES.

DR. CAMRNS (1), the Principal of the United Presbyterian College, was requested by the Trustees of the Cunningham

(1) *Unbelief in the Eighteenth Century; being the Cunningham Lectures for 1880.* By John Cairns, D.D., Principal and Professor of Theology in the United Presbyterian College. Edinburgh: A. & C. Black. 1881.

Lecture in the Free Church Communion to undertake the delivery of the course of lectures for 1880, and chose as his subject the tracing of the general history of unbelief in Christian countries during the period subsequent to the Reformation, especially in the eighteenth century. The task was, in one sense, a sufficiently thankless one, since nothing can well be drier or more devoid of living interest than to pass along a track of continually repeating barrenness and stunted or withered growth; but the record has its side of obvious usefulness. To a young man, less perfectly instructed in the wisdom of the past than assured of his own in the present, and ready to pick up and treasure any fragments of exploded opinion which may fall in his way as though they were entirely new and invaluable discoveries, the mere collection and enumeration of the names and arguments of writers of the various schools of scepticism must almost of necessity have the effect of opening his eyes and directing them towards a wider horizon; and the dry and unlovely waste presented as the view is shown successively in England, in France, and in Germany, may not unreasonably be expected to dispel the illusions which lie around the first steps in the path of unbelief.

Under the perhaps somewhat ambitious title of *Our Own Country* (2) Messrs. Cassell and Co. have published a fairly well executed collection of woodcuts of various scenes and buildings of interest to be found in Great Britain and Ireland. The sister isle is, to be sure, not very well treated, the scene selected from her for illustration being one which has the least pleasant sound of all to Irish ears—the river Boyne. We doubt whether the majority of that portion of the inhabitants of "our country" which lives on the other side of St. George's Channel will agree with the writer of the text attached to the illustrations, that the Boyne bears a name "dear to the heart of every British lover of freedom, religious and political." Perhaps the writer's indignation about the massacre at Drogheda and the space devoted to the Lakes of Killarney may be taken as an offset to this. Scotland, doubtless in a spirit of impartiality, is also confined to two chapters, one on Aberdeen and one on Loch Maree. The drawings are fully up to the level of the weekly illustrated papers, and the text is fairly well filled with useful information. The remaining sixteen chapters are devoted to English and Welsh subjects, chosen very much at random—towns, landscapes, and castles. The book may be recommended to readers who are in absolute ignorance of the fact that there is anything of any particular interest outside of London, and may be dipped into on a Sunday with safety by persons of a scrupulous conscience.

Dr. Diver's little book, in spite of the immense parade of its title, seems to be a very handy collection of good advice to a medical student (3), or rather to the doctor who has just passed beyond the student stage. We do not know how far the brief notes about drugs scattered up and down the book can be of any use to anybody, but the hints given as to a choice of practice will no doubt be welcome.

From the biographical notice prefixed to a republication of his papers (4), we learn that the late Rev. John F. Sergeant was a respectable and respected Churchman, who did, like many of his class, much good charitable work. This accounts for the regard in which he was held by his friends, but scarcely justifies the reprinting of commonplace matter written in a bald style.

The reading public will be grateful to Mr. Bohn for having published a volume (5) the worth and usefulness of which were fully recognized when it was privately printed "nearly fourteen years ago," as we learn from the preliminary notice. At that time only five hundred copies were struck off; and Mr. Bohn writes, "as applications for the book continue to be made, many of them with considerable earnestness, occasionally coupled with a remonstrance against my making it so exclusive, I have at length consented to comply with what seems to be a public demand." The writer goes on to hope that the result will justify his action in the matter; and as to this we can have little doubt.

The "Eversley Edition" of Kingsley's writings, which is issued by Messrs. Macmillan, and of which the first instalment is the ever-fresh *Westward Ho!* (6), is printed in capital type, and in every way well got up.

Mr. Black has written for the "Holiday Number" of the *Illustrated London News* (7) a story which shows his skill in making interest out of materials which might seem flimsy enough in less keen and practised hands. The author manages to give life to every one of his characters; his descriptions are, as usual, excellent; and a certain excitement is artfully maintained up to the end. The treatment of an episode of a nature which it is certainly not too easy to handle is especially praiseworthy. We must not omit a word of high commendation for the illustrations.

(2) *Our Own Country; Descriptive, Historical, Pictorial.* Illustrated. London, Paris, and New York: Cassell & Co.

(3) *The Young Doctor's Future; or, What shall be my Practice?* By E. Diver, M.D. London: Smith, Elder, & Co.

(4) *Two Cities; with other "Papers Practical."* By the late Rev. John F. Sergeant. London: "Home Words" Publishing Office.

(5) *A Dictionary of Quotations from the English Poets.* By Henry G. Bohn, F.R.S., &c. London: Published for the Author by George Bell & Sons.

(6) *Westward Ho!* By Charles Kingsley. 2 vols. London: Macmillan & Co.

(7) *Holiday Number of the Illustrated News—That Beautiful Wretch; a Brighton Story.* By William Black. London: "Illustrated News" Office.

The eighth volume of Mme. de Witt's excellent translation of M. Guizot's *History of France* (8) has lately appeared.

The Ulster King of Arms has compiled a volume (9) the title of which is enough to indicate its usefulness, while the arranger's name is a sufficient warrant for its accuracy.

The pieces contained in the second series of Mr. Gilbert's plays (10) have already been criticized in these columns. The volume contains nine pieces, including such very different works as *Dan'l Drown* and the *Prudes of Penzance*. Although we are glad to see *Gretchen* again anywhere on the stage, we regret to observe that Mr. Gilbert has not suppressed the "note" at the end of his list of dramatic *personæ*. It is quite unnecessary to inform the public that "the leading idea of this play was suggested by Goethe's *Faust*." There is something very ludicrous in the superfluous care shown by Mr. Gilbert in guarding the originality of his dialogue in all the scenes but the best. It will scarcely be disputed.

It is somewhat late to publish an account of *Lerkosia* (11), apparently written before the English occupation of the island; but the description published under this title by Messrs. Kegan Paul may be found interesting, and the simplicity of its style inclines us to accept it as accurate in its facts. The plates are fairly well drawn in outline, but are somewhat poor from want of details. The book gives a vivid impression of the island's curious mixture of East and West.

The fact that Mr. F. Hyndman's *Tour* (12) should have reached a second edition shows that perfectly obvious and commonplace observations on the best known parts of Europe, conveyed in a bald style, can, when flavoured by evangelical piety, attain to wide popularity in some reading public.

Mr. Brander Matthews is already well known as a keen dramatic critic and accomplished writer, and the brief preface which he has written for a little volume of drawing-room plays (13) is, as might be expected, full of sound judgment. To the plays themselves it is, unhappily, impossible to give one word of praise.

Mr. MacGeorge has produced an interesting monograph on flags (14), not the least curious passage of which is that in which he points out the heraldic inaccuracies in the construction of our national flag and in the design on our bronze coinage. According to the verbal blazon of the flag, writes Mr. MacGeorge, avoiding technicalities as far as possible, "the flag is appointed to be blue, with the three crosses, or rather the one cross, and the two saltires combined." And, to avoid the mistake of colour on colour, "it is directed that when the red crosses of England and Ireland come in contact with the blue ground of the flag, they are to be 'fimbriated'—that is, separated from the blue by a very narrow border of one of the metals—in this case silver or white. . . . To use the words of the written blazon, the St. George's cross is to be 'fimbriated as the saltire.'" The author goes on to point out that, while the red saltire of Ireland is accurately fimbriated, the St. George's cross is not fimbriated at all, being placed upon a ground of white so broad that it ceases to be a border. "The practical effect of this, and its only beneficial meaning, is that the centre of the flag, instead of being occupied solely by the St. George's cross, is occupied by two crosses, a white cross with a red one superinduced on it." A mistake of a somewhat similar character is detected in the design on the bronze coinage of England.

The latest addition to Messrs. Kegan Paul and Co.'s *Parchment Library* is *Shakespeare's Sonnets* (15), to which Mr. Dowden has prefixed an interesting and well-proportioned introduction. It is unfortunate that the leaves refuse to lie open, and we fail to see what is gained by printing the whole book with long s's.

There is, of course, a special fitness just now in the appearance of a second edition of Mr. Stephen's excellent translation of Lermontoff's poem *The Demon* (16), which it will be remembered gave Mr. Rubinstein the subject for his opera lately produced at Covent Garden.

Mr. Jolly justifies his new book on Burns (17) by saying that "in such a subject new presentation is more than mere facts, and this the present volume claims to be. It is a study of the old story in connexion with a new and marked personality." This apparently means that Mr. Jolly, having met and talked with one Willie Patrick who had been a farm servant to Burns, has

written a little—fortunately a very little—book on the old story and disjointed chat.

Mr. Baker, who feels compelled to write about his exceedingly commonplace travels (18), says:—"To the sympathy of the many, therefore, this work appeals; and, if it but find favour in their sight, the object in writing it will indeed be fully gained." As the many seem now to be unable to abstain from writing about their journeyings, they will perhaps appreciate Baker's account of his.

Mr. Palgrave has formed, by extracts from many writers, have either worked professedly for the young or whose work can be used for them, a *Reading-Book* (19) designed to instil into the minds of children the main facts of political economy. The extracts are naturally rather devoted to good advice than to science.

There was certainly room for Mr. Swettenham's *English-Malay Vocabulary and Dialogues* (20), in which his objects have been, amongst other things, to compile a vocabulary which shall contain every word likely to be met with in ordinary reading, writing, or conversation, and "to express in the Romanized Malay, as nearly as possible, the exact pronunciation of the Malay word." This is, perhaps, about as difficult a task as a person can set himself with any language, and, for reasons which will be obvious to him who read Mr. Swettenham's proface, it must be especially so, in the case of Malay. Mr. Swettenham has certainly spent much as to attain his object. It would be interesting to discuss in order to a careful student of his work could get to the accuracy and listen to the Malay. There is a well-known story of a man who had in his tongue a native before he had ever been in the East, and he supplied him with exceptional case.

Sea-Air and Sea-Bathing (21) seems a sound and useful book, in which the suggestions for precautions against the methods of meeting it when it comes are particularly noteworthy.

Mr. Parker Gillmore's *Encounters with Wild Beasts*, the admirable book bristling with exciting adventures, the truth upon a certain vouched for by the author in a few lines of preface.

A second edition has been published of Mr. Grigor's *Arboreal Culture* (23), to supply the demand caused by the extraordinary success of the first. In a short preface Mr. Grigor states that his interest in the subject prevented him from revising or adding to the work as it grew.

Under the care of Mr. Warner a *Catalogue of the Manuscripts of Dulwich College* (24) has been published, which is, apparently, full and accurate.

The Art Union of London issue for presentation to their subscribers this year a series of the plates engraved by M. Flameng. "From," as the announcement runs, Mr. Frith's "Road to Ruin." As a matter of fact they serve to show how great an artist M. Flameng is.

(13) *Days Afoot and European Sketches*. By James Baker. London: Simpkin, Marshall, & Co.

(14) *Political Economy Reading-Book*. By R. H. Inglis. London: National Society's Depository.

(20) *Vocabulary of the English and Malay Language*. With a single word Vol. I. English-Malay Vocabulary and Dialogues. Singapore: Printed by Mr. Frank A. Swettenham, Assistant Secretary for Native Affairs.

(21) *Sea-Air and Sea-Bathing*. London: Ward, Lock, & Co.

(22) *Encounters with Wild Beasts*. By Parker Gillmore, Author of "A Ride through Hostile Africa," &c. London: Allen & Co.

(23) *Arboreal Culture*. By John Grigor. Second Edition. Edinburgh: 1881.

(24) *Catalogue of the Manuscripts and Muniments of Alceyn's College of God's Gift, &c.* By G. F. Warner, M.G. London: Longmans & Co. 1881.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 4d., or \$7 6s gold, and may be forwarded direct to the Publisher, Mr. DAVID JONES, at the Office, 38 Southampton Street, Strand, or to Mr. D. F. STEVENS, American Agency, 4 Trafalgar Square, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Notre des Capucines.

The SATURDAY REVIEW is duly registered for transmission abroad.
